arisen. The Partridge Wyandotte Standard calls for slate undercolor and some breeders and judges want it nearly black. The undercolor of all black breeds is dull black and what black breed now recognized among Standard breeds is high in popular favor? Not one, except it be the Black Leghorn in the east, where breeders are ignoring the blind and unreasonable Standard law for black undercolor and are now allowing light slate or light grey with white into skin in males, as the proper undercolor to enhance the utility or commercial value of the Black Leghorn, as well as a great factor in harmonizing in making the surface plumage of higher quality and finish. The Jersey Black Giants are a popular black breed, popular because of their recognized market factor of a light grey undercolor that runs white into skin.

Standard writers, judges and fanciers who have controlled the Standards have these many years been blind to the economic values of utility factors which undeniably control popular favor, and to match this, utilitarians have ignored those fundamental requirements which are necessary to produce the highest values and enhance the utility factors. The seemingly wide gulf between the fancier and the utility breeder can be attributed to nothing else but lack of understanding of each other's desire and the absence of cooperation toward the more profitable union of the two forces.

The time has fortunately arrived when pure-bred Standards are being written to include significant utility qualities that in no way tend to depreciate the Standard quality or value of any breed. The greatest work done by our much complimented revision committee was writing into the 1923 Standard that Silver Penciled and Silver Laced males were to have slate undercolor running light at base of neck and saddle; that Black Giants were to have light undercolor at skin; that Partridge males and females were to have "slate" undercolor, the word "slate" being anything that stopped short of white; that Black Leghorn cocks were to be allowed some white at base of hackle and saddle. That is opening the door to economic quality as well as a step in the common sense of mating and judging. With the door open and our stepping toward it, we may expect further development along this line with future revisions of the Standard.

The people of Belgium years before the war understood the economic value of an undercolor which left no black pigment in skin when the carcass was dressed for market. They bred their Cuckoo Malines or barred fowls, and even their Black Malines with the light grey or white undercolor. Until the Knoxville meeting that Standardized the Giants, Belgium was the only country with a recognized black breed that had white undercolor.

Summed up, the ideal market fowl is of no particular breed or breeds, rather the ideal market fowl must have flesh quality and a tender, palatable flesh quality or "bite-ability," a marketable skin color free from pigment discolorations, with the ability to grow flesh quickly to produce desirable broilers and roasters at a minimum cost. Any standard breed that meets the above requisites, because of pure-breed worth, will be more popular as a meat or market fowl than any first cross of two breeds ever produced, just as recognized Standard egg breeds are more popular as egg producers than mongrels or first crosses. The reason is that when you attempt to perpetuate a cross, to breed the cross-bred birds together, the cross breaks down, the different qualities no longer blending in the offspring. Instead of a desirable blend you get all manner of extreme types.

The problem of the dual purpose fowl, which produces eggs in the greatest abundance, even superior to bred-in egg breeds, as well as flesh quality and quantity beyond the recognized meat breeds, is a riddle that is attainable with certain limitations. The difficulty is in uniting the two temperaments, a difficulty that reveals man's inability to unite fundamentally opposite forces in nature in one fowl or breed. The dual purpose fowl is really more numerous and in a total of its various breeds is more popular than either the highly specialized egg fowl or meat fowl, yet it is a medium type, a happy blend, a balance, and while it can be specially bred so as to equal if not rival any breed for meat production, or egg quality, the fact remains that the dual purpose type is most popular when the balance between eggs and meat is maintained. These big, general purpose fowls are popular, and are bound to grow in popularity, but as mentioned above, the day of the meat fowl "par excellence" has dawned and popularity in the markets of the nation await its production in commercial quantity.

ILLINOIS BAND & SUPPLY CO., Aurora, Illinois

How the Big Poutrymen Succeed

(Continued from page 916)

easy to have sent all the chicks at one time! How easy for the customer to have lost half or more of them by insufficient experience, by crowding, overheating!

We see, therefore, by this single example, that honesty must be coupled with a keen understanding of the business in general and the customer's needs in particular. A properly worded letter which inspires the confidence of the prospective customer, is the desire of this successful poultryman.

The word "Service" has been pretty well worn thin in the past few years. And yet I shall risk the danger of a repetition if I use it in this connection. The one paramount desire of the real poultryman is to do business upon such a high plane of integrity and helpful service as to make his customers his fast friends and enthusiastic boosters, thereby creating a free, yet invaluable source of new business. We find that fully 50 per cent of all business done by the truly successful poultrymen is "repeat" business, or that secured thru the recommendation of satisfied customers.

Letter number 2 is of a different character. A woman of moderate means had sent in her deposit of 10 per cent early in the season, for the purchase of 100 chicks. At the last moment she finds that she cannot purchase them. What does Mr. Poultryman do? Keep the deposit money which is legally his? No. He returns the money, expresses his regret that she must be deprived of the pleasure of having the chicks she so much wanted, hopes to be able to serve her later, etc. Can one doubt the feelings of the lady in question?

The ability to write fluently and rapidly is a trait of great value to the successful poultryman. He usually possesses it. Letter 3 in our morning's mail is from a man who wishes a cockerel. He describes, unconsciously perhaps, and in some detail a bird such as took the blue ribbon at a show he attended. He thinks he will be satisfied with nothing less. But we find that he wishes to and can pay only a nominal price for the bird. It is of course impossible to fill such an order as it stands. Mr. Poultryman writes Mr. Amateur that he must realize that to breed and produce such a specimen as he describes requires the culling down of hundreds of good cockerels; that there are only a few such birds each season on any breeding establishment, and that they naturally come high. However—and here is where his salesmanship comes to the front—he feels convinced that a cockerel of somewhat less outstanding qualities will do him really quite as well. He is prepared to ship him a strong, well-colored and shaped male from unquestioned blood lines, which will increase the egg production and appearance of his strain to a considerable degree; that many of the less perfect fowls are really better breeders, and that it is hard to combine every quality in any one male, no matter how valuable he may be, etc., etc. In many cases the order is secured, for that is really about what the customer had in mind. In any event, the position of the farm is unquestioned. Had the same bird as described been shipped without any qualifying statement, the customer would probably have been dissatisfied, have returned the bird with a few sarcastic remarks, and all would have been harmed by the transaction.

The successful poultryman, we see, is a business getter by the printed word. He can only meet a few of his customers personally, so he goes to them by Uncle Sam's help. The instant a successful poultryman's business becomes too large for him to oversee carefully, that instant the business becomes endangered. The poultry business, especially that of the better sort, is a personal sort of thing. We cannot ship out one gross of assorted goods, send shipping invoice, and expect satisfaction. To most the purchase of a good cockerel, a pen of high producers, or a hundred chicks is an important and personal matter. The purchaser expects a personal letter, advice when needed, and any other little touch which makes the transaction of real importance to him. It is a fact that the largest bulk of all the business done by the successful poultryman—aside from the table eggs sold—consists of small orders, ranging from a few to several hundred chicks, one or several males, a pen or two of extra good females. The thousand chick order is rather the exception, except with the largest establishments, and of course not considering the commercial hatcheries.

Now letter 4 comes from a dissatisfied customer. He must be handled again differently. He says, in short, that the hundred hatching eggs shipped to him do not please him; that some of them are rather small, the color not right, all not of perfectly uniform shape, and

"DANDY" BONE CUTTER Only \$5.00 Down

CLOVER CUTTERS, FEED AND GRAIN MILLS FOUR MONTHS TO PAY

Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood and feathers. Write for our free booklet and easy payment plan. We also sell on 15 days trial, no money in advance. The "Dandy" costs less than most bone-cutters and it works infinitely better. To insure big sales this year we have made special reductions in prices. Don't delay. Write now.

"I am just writing the news of my great 70th Annual Sale"

Here it is, late summer—and I am coming to the close of my biggest and best season. Undoubtedly the tremendous demand this summer for "Famous" Anconas was accelerated by my phenomenal success at Madison Square Garden early in the year when I recorded the 14th great consecutive winning by capturing TEN FIRSTS from a possible twelve.

I consider that the "Famous" Anconas I have to close out at the special prices are even better than during former years—but I haven't so many of them.

First Come—First Served

It is good, sound advice to suggest that you write immediately for the Special 70 Sale circular—which will be ready for the mails by the time I have your letter—and post yourself on the very special prices offered on "Famous" Anconas.

Whether you are interested in Anconas from the standpoint of prolific egg production, the astounding beauty of the strain, or their amazing performance at the shows, get my special sale circular at once.

that he is surprised that such a farm would send out such "stuff." Mr. Poultryman investigates the shipment, and unless there has been some gross carelessness at his end of the transaction, he will probably answer the man in somewhat this fashion: He will deem it a favor if the customer will return the eggs, and that others will be sent in their place immediately upon receipt of the first lot; that the selection of hatching eggs is always attended by chances of not pleasing the customer exactly; that few eggs are absolutely alike; that in the matter of color there is bound to be a slight variation at times; that large eggs, or those larger than the first class table eggs are not considered best for hatching purposes; that the farm makes it a rule never to send out eggs weighing less than 24 ounces to the dozen; etc. In any case, the matter is made clear, the eggs shipped, and thus things are adjusted frequently. Should the returned eggs prove to be normal, the poultryman has a come back if any further trouble occurs. No one is free from this class of buyers. We will have them always and everywhere.

Advertising Methods Employed.

Aside from this very brief study of the correspondence methods of the successful poultryman, it may be well to study his plans of advertising. A glance through our poultry journals will reveal many things. The outstanding successes in the business certainly are persistent advertisers. They may not always be the largest space consumers. But they stick to it year after year until the name of the Wyandotte, Red, Rock or Leghorn becomes associated and identified with a few of the leading breeders of the country. One thing we will notice: A better, more temperate, straightforward style of publicity is becoming the vogue, most fortunately. The flamboyant methods of years ago are fast losing favor among the better class of advertisers. Another thing we see is that as competition becomes keener, statements become more specific. Gone are the days when the successful breeder can advertise vaguely the merits of his breed. He must show performance and figures, backed by convincing authority. The egg laying contests have brought this about in the past ten years. The trap-nested breeding establishments show such an array of ancestry, such records for consistent heavy laying, both in contests and on their farms, that unless we have something real to offer the public, we cannot expect the high price business that is ours if we can secure it. Some years ago the highest priced specimens were those winning the blue ribbons at our leading poultry shows. While this still holds true to some extent, we find that the general public is more willing to pay for high record hens and males, chicks and eggs from trap-nested, certified stock, than for so-called "fancy" specimens. In fact, some of our star egg performers cannot be bought for any price, and many chicks from the leading pens bring tremendous prices. We will not take up the relative merits of the fancy and commercial price question here. We are concerned merely with the actual quality needed to place us in the front rank of poultrydom. Whether the poultryman be a leader in one or the other branch, or both, he must reach, and then maintain a standard of quality far above the average run of even the good poultry producers and breeders. Then he deserves the higher prices, the increasing patronage, the enhanced reputation, and all the other good things that come with them.

Summing up the matter we may say that the really successful poultryman is:

1. A breeder of the highest order. A man who combines a love of his business with a very profound knowledge of its possibilities. He must be able to follow a distinct, progressive line of breeding development, and know at all times to what goal he is aiming.
2. The possessor of a farm that permits the perpetuation of the finest specimens. This means ample and proper housing, range and care. Many commercial enterprises eventually fail for lack of these essentials. Crowding many birds on a small space produces a large percentage of culls, few good specimens, and no one can stand the strain—especially the fowls themselves.
3. A good salesman. Through his advertising, his business correspondence, his records in the egg laying contests or in the show room, he must be able effectively to place the merits of his breed before the buying public.

If he is able to write articles at times for the poultry magazines, so much the better. If he is capable of lecturing before a student body or some other poultry gathering, it is an added feather to his cap. In whatever way, therefore, he may bring his name before the poultry public, so long as it does not

interfere with his producing business, he will find it to be of distinct help to him in the building of his reputation.

4. One never to be tempted to allow quantity to overrule quality. The truly successful poultryman shows a remarkable production for the size of his plant, but he does not allow the size to grow beyond the safe standard set for his breed and capacity. If his plant may safely carry 1,500 breeders each season, he regulates his sales accordingly. He knows about how many eggs, chicks, breeders and pullets he may safely promise each year. He will not be tempted to increase his incubator, purchase eggs from surrounding sources, sell them as his stock, and reap the larger income thereby. What he sells he knows to be of the best, and no temptation, no deviation from this straight source will affect him in the least. If he does permit it, sooner or later the fine edge of his quality business is gone and he has lost his hard attained position of former years.

The foundation of every successful poultry business is based upon these foregoing essentials. How you attain them is secondary. The field is wide open to everyone. Our own limitations only hold us back from reaching the goal of success, no matter how high we set it for ourselves. Of one thing we may rest assured. We cannot attain it in ten easy lessons. Hard, conscientious work, a deep and abiding love for our fowls, and that keen knowledge, understanding and vision which most of us may possess if we but put forth the mental effort are the keystones we must have to reach the enviable height which inspire our respect and admiration.

Great Poultry Show at New York State Fair

(Continued from page 914)

of the prestige of a win of first or second at this nationally important fall show. Here and there are young birds that are over-shown, with the result that they are in a debilitated condition. It is not customary to withhold prizes, and perhaps it is just as well to place these doubtful specimens as long as there is nothing better. This again brings forcefully to attention the wide opportunities that lie open to young breeders in a number of the old, yet meritorious varieties. Men who will specialize on any of a dozen or twenty or the breeds will make a name for themselves. What can be done is seen in the Silver Gray Dorkings and Mottled Houdans at this show.

A year ago we remarked about the pale shanks in several of the white plumaged breeds. It is gratifying to see that more attention is being paid to this quality. Only one string of white plumaged birds in the yellow-shank varieties had noticeably poor leg color at this year's exhibition, and a number of those birds were not placed.

Some of the eastern judges are allowing considerable latitude on disqualifications. The great practical virtue of the Anglo-Saxon people has been obedience to law. Everywhere one sees a strange change coming over people. There are those who try to thwart the administration of law, there are those who fail to respect or grasp the function of law, and who "like to be different" and disregard the law. No judge is higher than the law. Some judges need to give more time to a study of the Standard law.

H. P. Schwab, for many years one of the leading eastern judges, is now devoting himself exclusively to the editorial duties of Everybody's Poultry Magazine. Mr. Schwab did not judge at Syracuse, although present, and will not judge at any of the winter shows, although he will be in attendance. Many exhibitors and show managements will regret to lose the services of so capable and popular a judge as Mr. Schwab.

Professor Jas. E. Rice stated during the fair that he had received a wire from Washington to the effect that poultrymen had won their tariff fight and the higher schedules had been approved by the Senate and House conferees.

Professor Rice expressed himself as especially pleased with the action of the American Poultry Association in inserting in the text of 1923 Standard instructions to the effect that poultry should be judged by the hand as well as the eye, and that back and body shape should be determined by handling to make certain that feathers do not cover certain anatomical faults and flaws which have a decisive bearing upon performance. Professor Rice stated further that he did not want a split, that he was opposed to fancy breeders and utility breeders going off on lines that did not meet, and he was glad to see and was anxious to further the program which would bring all breeders to-

"No Lice on Me!"

AFTER numerous tests with different materials for destroying lice on poultry, the U. S. Department of Agriculture found nothing so effective as

Sodium Fluorid

The method of using and the remarkable results obtained are published in U. S. Dept. of Agriculture Bulletin 801.

Clemson Agri. College, So. Carolina, says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried."

Twenty-odd other State Exp. Stations say the same.

R. T. Parkhurst, Head Dept. of Poultry Husbandry, Idaho Agri. Exp. Station, says: "It (Ivo-San Sodium Fluorid) is a very satisfactory control measure for lice. For the price, I consider your product superior to any I have had the opportunity to handle."

"Sodium Fluorid is the only lice remedy that will kill all kinds of poultry lice." (Southern Agriculturalist.)

Andrew Small, Rock Springs, Wyoming, says: "I used Sodium Fluorid on my chickens three years ago and haven't had a louse on my chickens since."

IVO-SAN SODIUM FLUORID

is air-floated, fine as flour, of highest grade, and unadulterated. Costs only 1/2c per fowl.

Also effective against cockroaches, water bugs, ants, plant lice, and lice on live stock. Two pound can, \$1.00; 4 pound can, \$1.75; 8 pound can, \$3.00; postage prepaid. Points outside the U. S., 10 cents per lb. additional. Copy U. S. Dept. Agri. Bulletin 801 with each order.

Orders filled on day received. If you want to test Ivo-San Sodium Fluorid before buying, write for free sample. Send today—solve your lice problem.

gether on the common ground of good Standard poultry.

This attitude on the part of a foremost educationalist is of significance. As a result of Professor Rice's past efforts, a great utility class has been developed at the New York State Fair. This year there were 102 farmers' flocks of 10 birds each in competition, an increase of 21 such flocks over last year. These birds are judged on the basis of body type, molting and pigmentation, in combination with Standard points.

When these farm flock classes were first introduced at Syracuse, there was some doubt as to their value. Many of the birds were shown in an untidy and sloven condition. This year not one of the many pens appeared in that slattern condition. The quality, from the Standard viewpoint, is advancing. There were pens of these farm flocks disqualified for Standard defects. The majority of the white birds were not in farm condition, but were acceptable show stock, and it appeared that exhibitors of these pens were being educated and encouraged in the breeding and showing of Standard poultry.

On the other hand, one sees prominent Standard breeders absorbing what is good in the utility program. H. C. Sheppard had a heavy laying Ancona hen on display which, when handled, had a good barrel of a body and carried her width well back from hips to stern. We also handled John Martin's first hen and first pullet. Two better birds have never been shown at an early show; in fact, the 1st pullet was ready for Madison Square Garden. These two females had round heads and bright eyes; not flat heads or skulls that overhung the eyes. No utility birds could have smoother, fresher, nicer heads. These females had smooth sides, nice backs, properly spread tails, and when you handled them from hips along sides of back to rear, they carried the width all the way back. Their bodies had a splendid span, with nice texture of skin on abdomen.

The first White Leghorn hen and pullet, shown by Schilling Brothers, were equally good when handled from a utility standpoint. A finer single comb White Leghorn hen than 1st was never penned outside of the Garden or Coliseum. She had been laying for three weeks, although B. O. Schilling stated that he had tried to hold her back for Syracuse by feeding her a handful of wheat in the morning and a handful of oats at night, taking away all mash feed. She had the graceful Leghorn lines, the true Leghorn spirit, the smooth plumage that is only seen in the best of birds, yet when handled her back carried the width to tail and her barrel was big, giving her a good abdomen. The same can be said of the 1st White Leghorn pullet.

It was plain that the farm flock class was showing the result of a wholesome desire and ambition to get more show room excellence into the birds, whereas three prominent breeders, Messrs. Sheppard, Martin and Schilling, were demonstrating an equal interest in those fundamental qualities of body type that indicate utility performance.

Syracuse is primarily a breeders' show. Superintendent Manning has never encouraged string men or car-lot exhibitors who make a business of exhibiting merely for the prize money to be won. The classes in the popular varieties are filled with splendid quality. It is a pleasure to see such birds. When a breeder brings forth a crop of good chickens in the beauty of full blossom they are bound to attract admiration. It is a creditable piece of work that the breeder has done, and in it there is something of satisfaction, even exaltation. It is not an avacurious business, this breeding business, in which only profits count. The show should reflect the pride and dignity of the breeding business and not be merely a place for some string man to pick up "easy money" in poorly filled classes. All help and encouragement to the owners of farm flocks who are coming up. Help them with friendly advice to breed and fit their birds better from year to year; but for the string man who is the experienced, professional exhibitor, let him receive the penalty when seeking to grab off the prize money with out-of-condition stock.

There were a great many specimens of well developed young stock at Syracuse. In S. C. Reds, a pullet, said by the owner to have been hatched Dec. 15, 1921, was placed 1st in the hen class. Later in the day the judge turned the card backward, and the next morning tore off the sticker. He then removed the 2nd hen up to 1st and so on. Rogers thus won 1st hen, a three-year-old matron of remarkable holding quality.

The judge did wrong in placing that pullet in the hen class and he did right in changing his decision. There is no definition of a hen in the Standard, but while there is no written law, there is a moral or common law. Everybody knows that a hen is a female that has

Small class. First cockerel and hen, nice pair. First, second and third cockerels, big, good substance of body; two spindle legged birds dropping to fourth and 5th. First, second pullets, big, well grown pair, good bodies, with soft sheet of buff color.

Silver Penciled Plymouth Rocks—Wilbur L. Wilcox, Nunda, N. Y., 1-2 cock, 2 hen, 2 ckl., 2 pl.; John C. Mitchell, Cambridge, N. Y., 3-5 cock, 3-5 hen, 1 old pen; John G. Linville, 4 cock, 4 hen, 3 ckl., 1 pl.; Oak Hill Poultry Farms, Montello, Mass., 1 hen, 1 ckl.

Five as good cocks as are ever seen; no one shows brass or straw color; big birds, silvery white tops, good striping. First hen, extra well penciled. First cockerel, looks more like cock. Second, raw stage of development. First pullet wins on color. Second, more of a Rock type.

Partridge Plymouth Rocks—Harry Katzen, Sykesville, Pa., 4 cock, 2 ckl., 3-4 pl.; W. Crandall, Syracuse, N. Y., 5 cock, 3 hen, 1-2 old pen; Frank B. Sutcliffe, Johnstown, N. Y., 1-3 cock, 4 hen; Farm Produce Stores Corp., Buffalo, N. Y., 2 cock; J. H. Webster, 1-2-5 hen, 3-4-5 ckl., 1-2-5 pl., 1 young pen; Geo. Rogers Eiler, Syracuse, N. Y., 1 ckl.

Strong class, hen class especially big with good quality throughout. Considerable style in first cockerel, with glossy coat of plumage, well marked. Nice pullets in type and color, with first a shade light in ground color of neck, but some good penciling showing in back and wing bows. Fourth, dark ground color.

Columbian Plymouth Rocks—C. D. Shaff, Baldwinsville, N. Y., 4 cock, 5 hen, 4 ckl., 3 young pen; Henry L. Wilbur, Tiverton, R. I., 1-2 cock, 1-4 hen, 1-2 ckl., 1 pl., 1 old pen, 1 young pen; James F. Harrington, Hammon, N. J., 3-5 cock, 2-3 hen, 3 ckl., 2-3-5 pl., 2 old pen, 2 young pen; W. A. Wolford, Lockport, N. Y., 5 ckl.; L. H. Wood, Syracuse, N. Y., 4 pl.; Sunnyside Poultry Farm, Syracuse, N. Y., 3 old pen.

First cock, easy winner. First hen, beautiful neck and white body. Second, close runner up, but more on Wyandotte order. Third, attractive but belongs in Light Sussex class, having white shanks. First cockerel, big, strong body, beautifully finished tail, nice color; an outstanding bird. Second, good neck, another good tail; younger. Some unplaced cockerels show brass. Beautiful class of pullets. Even some unplaced that would be an attraction in many shows. This variety always holds strong at Syracuse.

Silver Wyandottes—W. E. Samson, Kirkwood, N. Y., 1-2-5 cock, 1-4 hen, 5 ckl., 5 pl., 1 young pen; R. C. Brown, Hagaman, N. Y., 4 cock, 3 ckl., 4 pl.; Allen Blodgett, Cobleskill, N. Y., 3 cock, 1 old pen; R. C. Carpenter, Middletown, N. Y., 2 hen; Kenneth Lieber, Homer, N. Y., 5 hen; Charlton Farms, Avon, N. Y., 3 hen; R. G. Williams & Co., Barre, Mass., 1-2 ckl., 1-3 pl.; R. F. Alden, Binghamton, N. Y., 4 ckl., 2 pl.; Chas. H. Goff, Marathon, N. Y., 2 young pen.

A blend of good and bad. First cock and cockerel, well built, good all around laced birds. A couple of the leggiest cockerels ever seen in a Wyandotte coop, one landing fourth on color merit. Good class of nice pullets, openly laced, and well grown.

Golden Wyandottes—A. P. Myers, Mohawk, N. Y., 1 cock, 1-3 hen, 2-3 pl.; John T. Bird & Son, Lockport, N. Y., 2 cock, 2 hen, 1 ckl., 4 pl.; John Rinehard, Oneida, N. Y., 3-4 cock, 4-5 hen, 3-4 ckl., 5 pl., 1 young pen; J. F. Scholz, Erie, Pa., 2 ckl., 1 pl.

First cock, orange ground color. Third, richer ground color, but not as well laced on lower breast. First hen, open lacing, good type and condition. First cockerel, small, very promising. Second, big bird; good. First, second pullets, choice team, clean lacing.

White Wyandottes—John S. Martin, Port Dover, Ont., Can., 1-2-3-4-5 cock, 1-2-3-4-5 hen, 1-2-3-4-5 ckl., 1-2-3-4-5 pl., 1-2-3 old pen, 1-2-3 young pen. Delta Farms, Rome, N. Y., 5 young pen; Benj. O. McClellas, Cambridge, N. Y., 4 young pen.

As usual, one of the feature classes of the show. The equal of first hen and first pullet have never been seen at a fall show. They have the size, shape and color necessary for New York or Boston. Indeed, first pullet a marvel, finished, smooth lines. Good yellow shanks right through. Cocks in grand feather, time of year considered, for nothing is harder to put down in a September show than a cock. Cockerels up to weight, finished exceedingly well and ready. Such an exhibit is a credit to the exhibitor and reflects to the credit of the purebred industry.

Black Wyandottes—John G. Linville, 1-2 cock, 1 hen, 1 ckl., 1 pl.; Pleasant View Farm, Horseheads, N. Y., 3 cock, 2 hen.

Buff Wyandottes—J. F. Kniffin, Waterloo, N. Y., 4 cock, 3-5 hen, 2-4 ckl., 2-4 pl., 2 young pen; Charlton Farms, Avon, N. Y., 2 cock; Andrew Riddell, Delmar, N. Y., 1-3 cock, 2-4 hen, 1-3 ckl., 1-3 pl., 1 old pen, 1 young pen; John M. Roberts, Granville, N. Y., 5 cock, 1 hen.

SIMCO BUTTERMILK EGG MASH

LOWERS COST OF EGG
PRODUCTION

Nutrients not found in grain are needed for big egg yields. SIMCO BUTTERMILK EGG MASH supplies a rich variety of them in dry buttermilk and sweet wholesome meat and bone products and a wealth of mineral and vegetable proteins.

The choicest dry mash ever put up—you are sure of eggs with it when all others fail. In a recent test covering a period of several months it took less than 100 worth of SIMCO BUTTERMILK EGG MASH to every dozen eggs produced.

Write for free illustrated booklet and new reduced prices on poultry supplies. O. H. Clough, Box 1, Union City, Ind.

Falling off in numbers this year. First cock, good feather, nice type and color. First, second, third cockerels, soft, rich color; clear tails, second being younger than other two. Second and fourth hens, in new feather, even color, good type. First, third hens, old feather, patchy. First pullet, top of the lot; well developed, even, soft color, clear tail. Five years ago Judge Howell started his campaign for size at Syracuse. He has put substance into the variety and new life into its breeders. Buff Wyandottes were never better. His selection of first hen this year was based on her generous proportion of body.

Partridge Wyandottes—Sheffield Farm, Glendale, Ohio, 1-2-3 cock, 2 hen, 1-2-3 ckl., 1-2-3 pl., 1-2 old pen, 1-2 young pen; J. F. Talinger, Rochester, N. Y., 5 cock, 5 hen, 5 ckl., 4-5 pl.; W. L. Bender, Angola, Ind., 4 cock, 1-3 hen, 3-4 old pen, 3 young pen; A. J. E. Butler, London, Ont., Can., 4 hen, 4 ckl., 5 old pen.

First cock, dark on wing bows; in good feather. Second, rich, medium shade of color; splendid type and condition. Third, lighter ground color; not as sound in lower breast. First hen, exceedingly well penciled, with second close runner up. Third, beautiful hen; more metallic in black pencil. Fourth and fifth, good hens. First cockerel, big, good type, some red on breast. Second, not quite as broad and massive as first; better comb and breast. Good condition in pullets from first to fourth, good penciling in those four birds, with first as good a Partridge Wyandotte as has been seen at Syracuse.

Silver Penciled Wyandottes—Oak Hill Poultry Farms, Montello, Mass., 2 cock, 1 hen, 1 ckl., 1 pl.; Pleasant View Farm, Horseheads, N. Y., 1 cock, 2 hen, 2 ckl., 2 pl.

First hen an exceptional specimen for clean cut penciling on a ground color free of buff, good size and type.

Columbian Wyandotte—Willis Myers, Saugerties, N. Y., 4 cock, 1 hen, 1-2-3-4 ckl., 1-2-4 pl., 1 young pen; John H. Horton, White Plains, N. Y., 2 cock, 2 hen, 2 ckl., 2 pl.; Oren Hanes, Potsdam, N. Y., 1-5 cock, 3-5 pl., 4-5 old pen, 4 young pen; Henry W. Polgreen, Brookview, N. Y., 3 cock, 4-5 hen, 3 old pen, 3 young pen; Austin G. Warner, Whitesboro, N. Y., 2-3 hen, 5 ckl., 1-2 old pen, 2 young pen; Allen P. Coventry, Rome, N. Y., 5 young pen.

Nice class right through. Young birds have good bone and size. Cocks free from brass, nicely marked, with good type. Hens not in as good feather as one would wish. Tops of the class seem to be in first cock, cockerel and pullet.

Black Java—L. Earl Thompson, Mason, Ohio, 3 cock, 1 hen, 2-4 pl.; Warren D. Thompson, Westmoreland, N. Y., 2 cock, 2-3 hen, 3 pl.; Sunnyside Poultry Farms, Syracuse, N. Y., 1 cock, 1 ckl., 1 pl.; John G. Linville, 5 pl.

First cock as good as they grow. Sounder lobe would help him. First hen, nice. Cockerels, little young. First pullet, long, not so leggy as to be narrow at hocks. Second pullet, good color and finish of plumage, but not as long in back or low in tail as winner. Third, fourth pullets, lanky legs, longer heads, but black faces; a type that would suit some of the old breeders.

Mottled Java—John T. Bird & Son, Lockport, N. Y., 1 cock, 1 hen, 1 old pen, 1 young pen; Pleasant View Farm, Horseheads, N. Y., 2 cock, 2 hen, 1 ckl., 1 pl.

No white splashed bird here; all mottled like a Houdan. The new Standard will call for this advanced color type.

Dominique—Pleasant View Farm, 1 cock, 1 hen, 1 ckl.

S. C. Rhode Island Reds—H. E. Watts, Monument Beach, Mass., 1-4 cock, 5 hen, 1-5 ckl., 2-3 pl., 2 old pen, 1 young pen; R. C. Carpenter, Middletown, N. Y., 3 cock, 3 hen; Owen Farms, Vineyard Haven, Mass., 2-5 cock, 2 hen, 2-4 ckl., 4 pl., 1 old pen, 2-3 young pen; J. DeVer Rogers & Son, Jr., Oxford, N. Y., 1 hen; Philip E. Smith, Roosevelt, N. Y., 4 hen, 3 ckl., 1-5 pl., 3 old pen, 4 young pen; Sheffield Farms, Glendale, Ohio, 5 young pen.

One of the feature classes of the entire exhibition. We have commented on this class in the introduction to this report. There is more to be said of a most complimentary nature. The pullets equal the White Wyandotte and White Leghorn pullets for full development, size characteristic of breed, and evenness and purity of color. Only in the best winter shows are young females of such quality to be seen. No reporter of the Syracuse event will overdraw the perfection, maturity and beauty of the first pullet; she is dark but not too dark, having richness of color. Beautiful heads and strong yellow legs feature the Red class. Mr. Delano's birds have splendid substance of body; a uniformity of type and quality right through. His cockerels have superior bone and the best of backs and bodies, being unexcelled in these important features, but lack full growth of feather, particularly in neck necessary for a fully finished bird. A

The Heart of the Hen is the Life of the Chick

Could your hen live without a heart?

NO!

Neither could she hatch her chicks without one.

Then why expect your incubator, which only attempts to imitate Nature, to produce perfect hatches, if it is incomplete? Read what the PULS-HART does, and what satisfied customers have said:

C. C. GLASFORD, 984 Virginia Ave., Peoria, Ill.

I found that when I used the PULS-HART the temperature in the incubator would rise 1 to 2 degrees above where it was when it was not running. Another thing I noticed, the eggs were very nearly all pipped on the 19th day; and, best of all, I never had a dead chick in the shell. My chicks are now about 10 days old that I hatched with it, and they are all same size, and I never had chicks do as well up to this time. I think the PULS-HART one of the grandest things ever invented to hatch perfect chicks.

HOMER FRITZ, Route 1, Agosta, Ohio. The tray we had the PULS-HART on hatched all but 9 out of 107 fertile eggs, where the other tray had over 40 pipped, but none got out. We are very much pleased, and will set our machine again with duck eggs. Let me know if you will give me the agency for them, as I am sure I can sell a great many for you next winter.

ERNEST W. MANN, 493 West Street, Randolph, Mass.

On April 7th my hatch was taken out, viz: Eggs in incubator, 120; not fertile, 25; left in incubator, 95. I took out of the tray 37 live chicks and one dead one; 5 eggs were pipped and have since hatched. Only one chick was dead in the shell. Only two were cripples. I used a "Mandy Lee," which I have owned more than 10 years, but have not used it very much lately. I certainly cannot praise PULS-HART too highly, as I have never had over 80 chicks before.

CLEMENS BLANK, Indianapolis Water Co., 113 Monument Circle, Indianapolis, Ind.

We have just completed a hatch in which we used the PULS-HART received from you some time ago. We had the best hatch we have ever had. Every egg that pipped was hatched out clean. I think the PULS-HART is a great thing for incubator hatching.

IT IS ADMITTED that your incubator, regardless of its maker, endeavors to imitate Nature, represented by the Hen, but that most vital organ—the Heart—which performs the most important function of all—has been totally disregarded.

Why is this? Because the effect of the heart beat of the Hen was not even thought of until the inventor of the PULS-HART, who spent fourteen years in painstaking experiments, discovered the close relation between vibration and perfect hatches.

Have you ever stopped to think of the results of the everlasting heart action of the Hen? Probably not. Years and years of the closest application and study on this subject were required to prove satisfactory the difference which exists between the Hen and the incubator.

Do you realize that the Heart of the Hen, operating incessantly for 24 hours every day, transmitting life and vitality to its hatching chicks, produces a tremendous force, which not only strengthens the chick, but also overcomes that greatest of all difficulties, dead chicks in the shell. The vibrations of this wonderful organ render easy the breaking of the shell by the young chick, and preserves its life and strength for its future growth.

The PULS-HART (patent pending) produces upon the hatching chicks in the incubator, the precise effect that the Hen's Heart does upon her hatching chicks.

The PULS-HART pays for itself many times over in one season in LARGER HATCHES OF STRONGER, MORE VIGOROUS CHICKS. There are thousands in use throughout this country, Canada and Australia. Read what users have said about the PULS-HART. Then send in YOUR order.

SPECIAL OFFER—We found last season that the majority of Poultry Raisers waited until the season had started, and then sent in their orders for immediate delivery. As a result we had more orders than we could handle promptly at that time, and had to cancel many of them.

In order to encourage buying before the hatching season, thereby avoiding the difficulty experienced last season, we are making this **SPECIAL OFFER**:

On all **ORDERS RECEIVED** up to Nov. 25, 1922, we are making the special price of \$3.85 each. You do not have to send in the full amount now. Send **ONE DOLLAR** for each device ordered, and we will ship whenever you wish, collecting the balance C. O. D. After Nov. 25, 1922, the regular price of \$4.85 will prevail.

You require a PULS-HART for each tray. You could not make a better investment.

GUARANTEE—We guarantee the PULS-HART against defects in material or workmanship for a period of one year.

GONICK'S POULTRY REMEDIES, 97 Reado St., NEW YORK

somewhat finer knit bird would finish earlier, but the backs and depth of body are unsurpassed. First cock, rich color, even all over, good finish, nice type. Second, tail molted. First hen, good quality throughout. First cockerel, similar in color to first cock, another magnificent specimen, but unfortunately got sick during the week. Second, another good one. First pullet, rich color, big, long bodied.

R. C. Rhode Island Reds—Alexander & Ferris, Union Springs, N. Y., 1-3 cock, 3 hen, 2-4 old pen, 3 young pen; Wm. Elger, Auburn, N. Y., 2-5 cock, 2 hen, 1-3 ckl., 1-3 pl., 3-5 old pen, 1-2 young pen; A. J. Relyea, Oneonta, N. Y., 4 cock; Geo. E. Haynes, Swanton, Ohio, 1 hen, 4 pl.; H. E. Humphrey, 4-5 hen, 4 ckl., 5 pl., 1 old pen, 4-5 young pen; Harry W. Alt, Buffalo, N. Y., 2 ckl.; R. Daniels, Wyandotte, Mich., 5 ckl., 2 pl.

A hot class. First pullet quoted at \$15; not coming in anything equal to the best of the Single Combs. First cock, broad feathered bird, splendid size and type. Second shows more effect of molt. Uniformity of color here and much better character of feather than used to be seen in Rose Combs at Syracuse. Both first and second hens, uniform color. Good ones, right down to fifth. First cockerel, even, rich color, good type. Second, again good type and even color, but not as rich in breast and sides of body. Second pullet, smaller than some. Third, black in lower neck.

S. C. Rhode Island White—O. G. L. Lewis, Paoli, Pa., 1-3 cock, 3-4 hen, 3 pl., 3 young pen; Lyle M. Gifford, Oneona, N. Y., 4 cock, 2 hen, 2 ckl., 1-2 old pen, 4 young pen; H. P. Phelps, Nedrow, N. Y., 5 cock, 5 ckl., 2 pl., 3 old pen, 5 young pen; Linwood Poultry Yards, New London, Ohio, 2 cock, 1 hen; Forrest G. Tyrrell, Lake George, N. Y., 5 hen, 1-3 ckl., 1 young pen; Clarence Smith, Jackson, Tenn., 4 ckl., 1-4 pl.; Thos. Bonny, Saratoga Springs, N. Y., 5 pl., 2 young pen.

A big class. If anyone thinks the Knoxville Convention settled this issue they are mistaken. Breeders still discuss the fallacy and futility of this variety. It seems that the better they get them the more they look like White Rocks.

R. C. Rhode Island White—Lyle M. Gifford, 3 cock, 1-4 hen, 3-4 ckl., 2-4 pul., 2 old pen; Stewart & Byble, Ossining, N. Y., 1-2 cock, 2-3 hen, 1-2 ckl., 1 pl., 1 old pen; Delta Farms, Rome, N. Y., 5 ckl., 3-5 pl.

First cockerel, distinctive Rhode Island type; splendid head, pure color; quality in plumage, giving satiny finish. First pullet another good one, nothing like a White Wyandotte in her. This variety is making substantial progress.

Buckeye—L. Earl Thompson, 1 cock, 1 hen, 1 ckl.; Sunnyside Poultry Farm, 2 hen.

Light Brahma—A. B. Curtis, Sylvan Beach, N. Y., 2-3-5 cock, 1-4 hen, 2 ckl., 1 pl., 1 old pen, 1-2 young pen; Preston C. Burger, Oneida, N. Y., 4 cock; J. H. L. Todd, Jr., Warwick, N. Y., 1 cock, 3 hen, 1-4 ckl., 2-3 pl., 3 young pen; Linwood Poultry Yards, 2 hen.

Cocks a hard looking lot, with first at top of the class. First and second hens, really good Light Brahmas. Cockerels young. Second pullet, good all over. First shy of foot feathering and practically no main tail.

Dark Brahma—Dr. S. Lott, Waterloo, N. Y., 4 cock, 4 hen, 2-3 ckl., 2-3 pl., 1 young pen; Oak Hill Poultry Farm, Montello, Mass., 2 cock, 1 hen; Sunnyside Poultry Farm, Syracuse, N. Y., 1 cock, 2 hen, 1 ckl., 1 pl., 1 old pen; John G. Linville, Urbana, Ohio, 3 cock, 3 hen, 4 ckl., 4 pl.

First and second cocks, big, good color. First has vulture hocks. Judges are careless on disqualifications. Birds with white in lobes, off colored shanks, and in this case vulture hocks win in defiance of the Standard. First hen, big, excellent penciling. Cockerels are young. First pullet as good as we have seen win at an early show.

Buff Cochins—John T. Bird & Son, 3 cock, 2 ckl., 1 pl.; Sunnyside Poultry Farm, 1 cock, 1 hen, 1 old pen; John G. Linville, 2 cock, 2 hen, 1 ckl., 2 pl.

First cock and hen, tops of class. Nothing of merit in Partridge or Black Cochins.

Partridge Cochins—Sunnyside Poultry Farm, 1 cock, 1 hen, 2 ckl., 2 pl., 1 old pen; Dr. S. Lott, 1 ckl., 1 pl.

White Cochins—Sunnyside Poultry Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 old pen.

Black Cochins—Sunnyside Poultry Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 old pen; John G. Linville, 2 cock.

Black Langshans—Fred E. Isbell, Saratoga Springs, N. Y., 2-4 cock, 5 ckl., 4-5 pl., 4-5 old pen; Mrs. W. H. Craig, Bath, N. Y., 1-5 cock, 1-3 hen, 1-2 ckl., 1-2-3 pl., 1 old pen, 1-2-3 young pen; J. F. Robinson, So. Weymouth, Mass., 3 cock, 2 hen; John C. Mitchell, Cambridge, N. Y., 5 hen, 4 ckl., 3 old pen, 5 young pen; E. J. Mesick, Ardsley, N. Y., 4 hen, 2 old pen, 4 young pen.

Increasing Langshan interest in East. Talk of big classes at both New York and Boston

combines hot air and water. Automatic control of heat, moisture, and ventilation. Center heat plan, round nest, eggs turn semi-automatically without removing tray—saves time and money. Simple, Safe, Sure. Express Prepaid. Write for BIG, NEW, FREE BOOK.

Porter Incubator Co., Box 39, Blair, Neb.

this winter. Good quality and a lot of competition at Syracuse. First, second and third cocks in good feather. First hen, good feather, nice color, good size. Not the backs and tails in hens we like. First, second cockerels, rangy fellows; need more time. First, second, third pullets, growthy, good color; quality here.

White Langshans—John C. Mitchell, 1 cock, 3 hen, 1 old pen; John G. Linville, 2 cock, 1-2 hen, 1 ckl., 1 pl.; Pleasant View Farm, 2 ckl., 2 pl.

Cocks ragged. First hen has size, type and nice color. First pullet, very good. Cockerels appear over cooped.

S. C. White Leghorn—A. & B. Schilling, Rochester, N. Y., 2-3 cock, 1-2-3-4 hen, 1-3-5 pl., 2 old pen, 3 young pen; Wilburtha Poultry Farm, Trenton Jct., N. J., 1-4 cock, 1-3-4 ckl., 2 pl., 1 old pen, 1 young pen; Elm Poultry Yards, 5 cock, 5 ckl.; C. L. Whiting, Rochester, N. Y., 5 hen, 2 ckl., 4 pl., 3-4 old pen, 2-4 young pen; Roy S. Rider, Ballston Spa, N. Y., 5 old pen; Williams Bros., Fullerton, Calif., 5 young pen.

Best class ever seen at an early show. Runner up to the Garden and Chicago Coliseum. Big entry. First cock, grand head and tail; nice station. Second, not as well finished in tail, but a beautiful back in spite of short feather. Third, biggest bird of three; excellent top line as well as underline; failing in pale shanks. First hen, New York quality and New York condition; in the pink; her equal never seen in an early show. Second, new feather, but comb lacks flush of winner. Third, big hen, good condition of feather. First cockerel, well grown cockerel, in nice condition; well put down. Second, stylish. Third, similar to first. Fourth and fifth, biggest bodies of the lot. Rich yellow shanks right through cockerel winners; all stand on legs of proper length that are strong and well set, not narrow. First pullet, beautiful head, magnificent condition of plumage; strong in back and tail. Second, another well grown pullet with beautiful profile. Third, here again is great quality; carries width into tail; lighter shanks. Fourth, lacks condition and quality for this class. First, second and third pullets, strong mature, useful birds with refinement of intelligent and skillful breeding.

R. C. White Leghorn—Damon R. C. W. Leghorn Yds., Ballston Spa, N. Y., 1-3-4 cock, 2-3 hen, 1-3-4 ckl., 2-3-4 pl., 1-2 old pen, 1-4-5 young pen; J. M. Chase, Wallkill, N. Y., 2 cock, 1 hen; Louis H. Perry, Clay, N. Y., 4-5 hen, 5 ckl., 3-4 old pen, 2-3 young pen; H. W. Durland, Middletown, N. Y., 2 ckl., 1-5 pl.

First cock, exceptionally good type and color for this class. Cockerels are growthy with good station; trifle angular. Females attractive, with first pullet a good Leghorn.

Dark S. C. Brown Leghorn—Albert G. Tilden, Fulton, N. Y., 1-2-3 cock, 1-2-3 hen.

Light S. C. Brown Leghorn—Albert G. Tilden, 1-2-3 hen.

A double classification this year. Some empty coops. First dark hen, big with nice feathering up onto tail. First light hen, nicely stippled, soft ground color; second, coarser marking.

Dark R. C. Brown Leghorn—Modern Poultry Yard, Orrville, Ohio, 5 cock, 5 ckl.; E. B. Cole, New Hartford, N. Y., 3-4 cock, 2-3-4 hen, 2-3-4 ckl., 5 pl.; E. B. Lampman & Son, Freeville, N. Y., 2 cock, 5 hen, 2 pl.; Harry R. Blackburn, Harriman, N. Y., 1 cock, 1 hen, 1 ckl., 1-3-4 pl.

Light R. C. Brown Leghorn—R. D. Button, Canastota, N. Y., 3 cock, 4 pl.; Duell C. Lake, Oneonta, N. Y., 1-2 cock, 1-2 hen; Modern Poultry Yd., 4 hen, 1 ckl., 3 pl.; E. B. Cole, 2 ckl., 1 pl.

About the usual run of quality in R. C. Browns. Nothing outstanding for quality. Cock 989, a caricature of a chicken.

S. C. Buff Leghorn—A. W. Dukin, Syracuse, N. Y., 5 cock, 1 ckl., 3 pl., 2 young pen; L. E. Merihew, Marathon, N. Y., 4 cock, 1-5 hen, 2-3 ckl., 1-2 pl., 1 old pen, 1 young pen; Frank Broughton, Syracuse, N. Y., 1 cock, 5 ckl., 2-3 old pen; Wm. E. Crevoiserat, Freeport, N. Y., 2-3 cock, 2-3-4 hen; Geo. J. Gable, Toledo, Ohio, 4 ckl., 4 pl.; Carrie Cornue, Apulia, N. Y., 5 pl.; J. E. Kaiser, Verona Sta., N. Y., 3 young pen.

Some good cocks, but several in poor feather. Nice color in the winner. Second in nice feather, with fourth appearing to have what is naturally the best back when all are in full feather. First hen, big, of good type, with a new coat of even, soft buff. Second to fifth close runners up, making keen competition. First cockerel has the advantage of size and a coat of golden buff. Second, nice head; lighter color. Third, younger; a bird of great promise, with a color and tail developing that will fill the eye a little later. Fourth, promising. Fifth, several holes in him. First pullet, the head, type and color all desire; two weeks young. Second, trifle bigger, soft color, but lacks a tone of gold. Third, promising.

S. C. Black Leghorn—Daniel C. Bristol, Bainbridge, N. Y., 3 cock; John E. James,

"Kerlin-Quality"

265-270 Egg Strain

English-American

Single Comb White Leghorn

Pullets - Hens - Males

Here's The Grain Sprouter You Want

30 Day's Trial—Money Back if Not Satisfied

Here's the grain sprouter that exactly meets the requirements of every poultryman. Whether you have a flock of 50 chickens or several thousand there's a style and size of

WISCONSIN

SECTIONAL GRAIN SPROUTER

to meet your needs—you add extra sections as you need them. Wisconsin Grain Sprouters, like the famous Wisconsin Incubators are built right. Strong wooden frame—heavy galvanized sides lined with thick sheets of Nuroid to retain heat. Wisconsin's are not affected by moisture—they can't warp, shrink or swell. Converts one bushel of grain into 3 bushels of tender sprouts.

Sold on 30 day's trial. Write for free catalog—learn how much better Wisconsin's are constructed, and how much lower our prices are than others. We pay freight—don't buy until you get our catalog. We can save you money.

WISCONSIN INCUBATOR CO., Dept. 32 RACINE, WIS.

Read These Letters:

Wisconsin Incubator Co.
Racine, Wis.
Purchased a "Wisconsin Sprouter" from you last fall and wish to say that it certainly has given me amazing results. A flock of chickens without one of your sprouters is not complete as well as unprofitable.

E. L. Lambert, Driftwood, Okla.

Wis. Incubator Co.
Racine, Wis.
I wouldn't be without my Wisconsin Grain Sprouter, as tender green sprouts keep my chickens healthy and doubles egg yield. Get more eggs in winter when the price is high than at any other time.

Mrs. Joe Denton, Sterrett, Tex.

Address house nearest you. Write to Dept. AP-10 THE COLEMAN LAMP CO., Wichita, Kansas Chicago Philadelphia Los Angeles

Laying Pullets

from heavy laying Hogan-tested stock. Rocks, Reds, Wyandottes and Leghorns at new low prices. **WECKEL BROS EGG FARM, Box 391-A, Moline, Ill.**

Jr., Reading, Pa., 2 cock; Wm. R. Mollineaux, Hempstead, N. Y., 1 cock, 3 ckl., 1 old pen; Clarence M. Davison, Hempstead, N. Y., 5 cock, 2 hen, 4-5 ckl., 3-5 pl., 4 old pen, 2 young pen; Wright Scidmore, Balston Spa, N. Y., 4 cock, 2-4 pl., 2 old pen; 3 young pen; A'onzio T. Losca, Hempstead, N. Y., 1-4-5 hen, 1 ckl., 1 young pen; Harvey A. Drew, Vernon, N. J., 3 hen, 3 old pen; Harry Pease, Hempstead, N. Y., 2 ckl., 1 pl.; W. A. Shafer, Oneonta, N. Y., 5 old pen.

First cock, good station and condition of feather; yellow shanks. Second, nice shank, sounder face, heavier comb. First hen, good shanks, rich green color. Second, nice hen; bad hind toe. Plenty of competition in the hen class. First cockerel, big, too high in shoulders. Second, good head, nice type, big; a superior Black Leghorn. Third, nice cockerel, not quite the station of second. First pullet, nice size and color; comb could be improved. Second, stylish.

Silver Leghorn—B. F. Ferguson, Dryden, N. Y., 2 cock, 2 hen, 2 ckl., 4 pl., 1 old pen, 1 young pen; F. O. Dudgeon, Cleveland, Ohio, 3 cock, 3-4 hen; Pleasant View Farm, Horseheads, N. Y., 1 cock, 1 hen, 3 ckl., 3 pl., 2 old pen, 2 young pen; Adam E. Patterson, Jr., 5 hen, 1 ckl., 1-2 pl.

Competition here. First pullet a beauty. S. C. Black Minorca—F. H. Riverburgh, Munnsville, N. Y., 5 cock, 5 young pen; Geo. C. Hicks, Marcellus, N. Y., 2 cock, 3 hen, 5 ckl., 1-4 pl., 3-4 old pen; 1-3 young pen; T. J. Ager, Munnsville, N. Y., 3 cock, 4-5 hen, 1 ckl., 5 old pen, 4 young pen; Onondaga Minorca Yds., Syracuse, N. Y., 1-4 cock, 2 hen, 2-4 ckl., 2-3-5 pl., 1-2 old pen, 2 young pen; Albert Hutson, Oneonta, N. Y., 1 hen, 3 ckl.

Cocks judged differently than we are accustomed to. First lacks length of back, but has depth from back through shoulders to front of breast bone. Second, longer, bigger, rangier and is the type that usually wins, but he is not as deep through shoulders to breast. Judge Northrup thus drives home the fact that length of legs and back is not all; there should be depth from shoulders to underline of breast, and from back to underline of body. First hen, big, long backed, deep bodied; good feather, rich color. Second, good condition of feather, but a smaller feather that lacks a bit in sheen. Third, quality here, but with condition seen in the breeding yard. A nice lot of cockerels, plenty big enough for September. First pullet wins here and now, but some younger ones will probably beat her later.

R. C. Black Minorca—Thos. Bonny, 3 cock, 1 hen, 1-2 ckl., 1-2 pl., 1 young pen; A. J. Relyea, 2 cock, 2 hen, John G. Linville, 1 cock, 3 hen, 3 ckl., 3 pl.

S. C. White Minorca—Hamilton Egg Farm, Rochelle Park, N. J., 4 cock, 5 hen, 2 pl., 3 old pen; H. B. Sharpley, Earlville, N. Y., 3 cock, 3-4-5 ckl., 3-4 pl., 1-2-3 young pen; Mrs. J. G. Osborne, Fabius, N. Y., 2 cock, 2-3 hen, 5 pl.; Mary Meiselbach, Melrose Park, Ill., 1-5 cock, 1-4 hen, 2 old pen; M. E. Fish, Mound City, Kans., 1-2 ckl., 1 pl.; C. G. Standard, Delphi Falls, N. Y., 1 old pen.

Four big, strong boned males in first to fourth cocks. Long backs and bodies. First, second and third hens in a row, a good trio. Second has great body, but heavy in comb. Third, best comb, but not quite the substance of second. First, good all around; white. Fourth, fails in color; fifth in condition. Nice smooth, white, shapely lobes on first three, a point some Minorca breeders, all varieties, overlook too much. First, second cockerels, the best team of White Minorca cockerels ever seen in Syracuse, and of all shows in United States, the White Minorca class at Syracuse is the best. These two cockerels are big, finished birds; pure white, big bodies, good length. First pullet, big, strong, shapely bird. Second, similar, but younger.

W. F. Black Spanish—C. T. Alden, Cobleskill, N. Y., 1 cock, 2 hen, 2 ckl., 1 pl., 1 young pen; Sunnyside Poultry Farm, 2 cock, 1 hen, 1 ckl., 2 pl.

First, second hens show to advantage, with young birds in good fettle. Blue Andalusian—Francis M. Wilson, Wilmamstown, Mass., 2 cock, 5 ckl., 2 young pen; E. D. Bird, Greenwich, Conn., 1 cock, 1-2 ckl., 1-2 pl., 1 young pen; Walter C. Done, Buffalo, N. Y., 3 cock, 1-2-3 hen, 3 ckl., 4 pl.; Farm Produce Stores Corp., 5 cock; Linwood Poultry Yds., 4 cock, 4-5 hen; Trout's Poultry Farm, Fostoria, Ohio, 4 ckl., 3 pl.; Roy E. Barnard, Westfield, Mass., 5 pl., 1 old pen; W. A. Shafer, Oneonta, N. Y., 2 old pen, 3 young pen.

First, third cocks, big, shapely, well laced birds. Second, lacking. First to fifth hens, good size, type and condition; clean ground color and good lacing throughout. First cockerel, well matured bird of good quality. Second and third, younger birds of promise. Fourth, more station, fails in head. First and second pullets, mature and ready. Third, sharply laced, trifle younger. A strong class of Blues.

R. C. White Minorca—Mrs. J. G. Osborne,

STOP ROUP CANKER CHOLERA

Keep Your Flock Healthy All
Winter—Get Lots of Eggs
When Prices Are High

Your best help to increase profits this winter is **Giles Poultry-Tone**. It keeps away disease, overcomes and expels all germ poisons, and is a wonderfully efficient tonic and conditioner. It is the best preventive and treatment of germ diseases money can buy. It tends to destroy disease germs, allays fever, soothes and heals the inflamed tissues. It affords prompt and permanent relief in all cases of Colds, Roup, Canker, Diphtheria, Cholera and Diarrhoea.

GILES POULTRY-TONE

Will greatly increase egg production because it increases the appetite, aids digestion, keeps the bowels active and regular. It tones up the egg making organs, develops the egg cells in the ovary so that you get more eggs, no matter how cold or wet the weather. Mr. Bonner's 24 old Leghorn hens averaged 183 eggs for year when Poultry-Tone was used.

Sold On Money Back Guarantee 20 Years—Without Request for Refund
Can that be said of any other remedy? Giles Poultry-Tone will positively give you absolute satisfaction in treating sick fowls, and greatly increasing egg production. You take no risk. Your money back if it fails. You can't afford to be without it. It's a sure money maker for you.
Price: 50¢ bottle; quart can equals ten 50¢ bottles, \$2.50 prepaid. Send for big free circular "Poultry Welfare." Send order today sure.

J. R. HUDSON, Printer, Hardin Springs, Ky.

1-2 cock, 1 hen, 1 ckl., 1-3 pl., 1 old pen, 1 young pen; L. L. Reed, Marathon, N. Y., 2 ckl., 2-4 pl.

Buff Minorca—Albert F. Loth, Buffalo, N. Y., 1 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 young pen; Sunnyside Poultry Farm, 1 old pen.

S. C. Mottled Ancona—Alfio S. Troja, Utica, N. Y., 2 cock, 5 hen; C. W. Simonds, Red Creek, N. Y., 3 cock, 3 young pen; Alfred Bischoff, Ballston Spa, N. Y., 1 cock, 1-3 hen, 5 young pen; W. F. Bast, Phillipsburg, N. J., 4 cock, 1 ckl., 1-3 pl., 1 young pen; Linwood Poultry Yds., New London, Ohio, 5 cock, 2 hen, 2 ckl., 5 pl.; C. E. Johnson, Ligonier, Pa., 4 hen, 2 pl.; Geo. W. Gehring, Woodhaven, N. Y., 5 ckl.; Mrs. L. S. Oatman, Marcellus, N. Y., 4 ckl., 1 old pen; C. A. Johnson, DeRuyter, N. Y., 3 ckl.; C. R. Kolbe, Syracuse, N. Y., 4 pl.; U. C. Kay, Ilion, N. Y., 3 old pen; Fay J. Dougherty, Syracuse, N. Y., 2 old pen; E. C. Vail, Verbank, N. Y., 2-4 young pen.

First cock, nicely marked with good head. Second, larger body, well furnished saddle; points of comb frozen off. Third, stylish. Fourth, fifth, blacker birds. First hen, nice type, rich black color, evenly mottled. Second, similar but whiter head. Third, heavier white mottles. Fourth, gray white tips on back. First cockerel, nice head, shapey, well grown fellow. Second, another nice cockerel. Third, younger; good head, splendid back; a comer. Fourth, white head; good pair of yellow shanks. Fifth, nicely tipped neck and saddle; needs time. First pullet, well matured, good type, nicely mottled all over. Considerable black in this pullet's shanks; the A. P. A. did well not to penalize this kind of shanks until we first see more pullets with the type and color of this first winner. Second, typical, but not as evenly mottled or with as much green in black as winner. Third, real Ancona, little more angular than a Leghorn; nicely marked; shanks as first.

R. C. Mottled Ancona—Linwood Poultry Yds., 2 cock, 2 hen, 1 ckl., 1 pl.; Pleasant View Farm, 1 cock, 1 hen, 2 ckl., 3 pl., 1 old pen, 1 young pen; Leroy E. Hepp, Syracuse, N. Y., 2 pl.

First pullet, good.

White Dorking—Chas. H. Yaple, Richford, N. Y., 1 cock, 1 hen, 1 ckl., 1 pl.; Sunnyside Poultry Farm, 1 old pen.

Silver Grey Dorking—Chas. H. Yaple, 1-2-3 cock, 1-2-3 hen, 1-2-3-4-5 ckl., 1-2-3-4-5 pl.; Sunnyside Poultry Farm, 1 old pen.

Colored Dorking—Chas. H. Yaple, 1 cock, 1 hen, 1 ckl., 1 pl.

As good White and Colored Dorkings as there are in U. S. In Silver Grays, first cockerel and pullet, two of the best grown, most mature birds in the show, and of a superior quality that would make every true Dorking breeder stand in admiration.

S. C. Buff Orpington—Egg-A-Day Farm, Vienna, Va., 1-3 cock, 2 hen; Maysake Farm, Hinsdale, Ill., 2-5 cock, 3 hen, 1-4 ckl., 1-5 pl., 2-4 young pen; Geo. E. Bessom, Mansfield, Mass., 4 cock, 3 ckl.; Lynn A. Wollaber, Mohawk, N. Y., 5 hen, 5 young pen; Owen Farms, Vineyard Haven, Mass., 1-4 hen, 2-5 ckl., 2-3-4 pl., 1-3 young pen.

Strong competition. First cock in splendid fettle; good color, type and size. Second, another good cock, but tail only partly in. Third, very pleasing bird with nice color, but does not handle as well in neck or wing secondaries. Fourth, higher stationed bird than other three. Fifth, a good cock from his head down; absence of tail or he would have gone higher. First hen, as good as ever seen at an early show; new feather, a level, soft tone of color, and shapey. Second, another big matron of good shape and color. Third, again a runner up, with length, depth and thickness; fails with ticking in tail. Close competition in cockerels between first and second. Both are good bodied birds, with same length of strong, pure white shanks; a soft yet lustrous sheet of golden color. Second has the best maturity. Both have good tails, without any bronze in tail coverts. Third, big, shade richer in color; trifle narrow and tight in tail. Fourth, strong headed, broad backed, deep chested, heavy boned fellow; needs more time to finish. First pullet, magnificent, true Orpington type and the real thing in golden, even soft shade of color. Second, nice color, little shorter than winner. Third, another beautiful pullet. The class as a whole stronger and better than last year.

S. C. White Orpington—Morris Poultry Farm, Lebanon, Ohio, 1-5 cock, 4 hen, 3-4-5 ckl., 1 pl., 2-3 old pen, 1-2 young pen; Burn Brae Poultry Farm, Toronto, Ont., Can., 2-3-4 cock, 1-2-5 hen, 1-2 ckl., 3-5 pl., 1 old pen, 3 young pen; Harry Paxton, Gloversville, N. Y., 3 hen, 2-4 pl.

Cocks look ragged, with the first in best condition and leads the class. First and second hens, big, broad, deep females; new feather, excellent condition. First cockerel, strong boned, good headed, well grown out chicken. Second, another shapey, well matured cockerel. Third, longer back; needs time to finish. First pullet, remarkable for purity of color; shapey.

Hens Not Laying?

Find it slow work getting 'em started? They have been weakened growing new feathers.

Pullets somewhat backward, too? Start them laying and paying for the feed they have eaten.

Here's the way: Give them the tonic and conditioner which successful poultrymen have been using for over 50 years. It builds up hens weakened from molting—starts them laying and keeps them laying all winter—develops pullets into Fall and Winter layers of high priced eggs.

Pratts Poultry Regulator

costs less than two cents a month per hen. In Nature's way—not by dangerous forcing or stimulating—it tones up and strengthens your birds so they can turn their feed into eggs. It's a safe and easy way to change your loafers into layers.

Test it on your own flock without risking a penny. Pratt Dealers everywhere are authorized to furnish Pratts Poultry Regulator on this guarantee—

"Your Money Back if YOU Are Not Satisfied"

Prevent roup, colds and other Fall troubles by disinfecting houses and utensils with **Pratts Poultry Disinfectant**. A safe, efficient and economical way to keep away disease germs and insect pests.

PRATT FOOD COMPANY

Philadelphia, Pa. Hammond, Ind. Toronto, Canada

For heavy egg production—use Pratts Buttermilk Laying Mash and Pratts Scratch Feed. Quality feeds made by poultrymen for poultrymen. They make eggs.

KILL THEM ALL

Every Rat and Mouse easily destroyed by New Discovery Not a Poison

Absolute freedom from rates and mice is now assured everyone. No more trapping and poisoning just a few. Clean out the whole bunch, old, young, big and little

Hick's Rat Killer kills every rat or mouse on your place. Most wonderful of all it does not harm anything but rats, mice, gophers, and other rodents. It is harmless to children, pets, poultry and all kinds of stock. It can be spread anywhere and will kill only rats and mice. This death bringing disease rapidly spreads and quickly destroys all the rats and mice. There is no smell or odor for they run outside for water and die away from the building.

A Trial Costs You Nothing

Mr. Hick is offering everyone troubled with these pests the chance to get rid of them at no cost to themselves. He will send two large double strength, one dollar bottles for the price of one. You keep one for yourself; the other you sell to your neighbor at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 103, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after 30 days trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

FRANK MYERS

Box 40

FREEMONT, ILL.

Both second and third have clean lines and make competition. Fifth, big, full pullet.

Dark Cornish—Ernest B. Stanley, Bennington, Va., 1 cock, 1-2 hen, 1 ckl., 1-2 pl., 1 old pen, 1 young pen; Fred H. Bohrer, Utica, N. Y., 2-3-4 cock, 3-4-5 hen.

First cock, broad, well set, short feathered. Second, little more bone, more length of drum stick and length of feather. Third, high shouldered, like a Pit. Fourth, big, but rangier. First hen, shapely; clean, rich ground color; nicely laced all over. Second, another good female with similar qualifications as winner. Third, paler ground color. First pullet, well grown, shapely pullet; nice ground color and lacing. Second, similar. First cockerel, good bone and spread of legs; a rare bird for an early show.

White Cornish—John G. Linville, 1 cock, 2 hen, 2-3 ckl., 2 pl.; W. A. Shafer, 1 hen; L. J. Smith, Deep River, Conn., 1 ckl., 1 pl.

White Laced Red Cornish—Mrs. Ernest B. Stanley, No. Bennington, Va., 1-2 cock, 1-2 hen, 1-2-3 ckl., 1-2-3 pl.; John T. Bird & Son, 3 cock, 4 ckl., 4 pl.

Good quality right through. Variety is coming fast. Splendid color, and approach the Darks in type.

Red Sussex—Sunnyside Poultry Farm, 1 cock, 1 hen; W. F. Evans, 1 pl.

First cock and pullet, best seen at Syracuse in several years.

Speckled Sussex—C. L. Hueber, Fayetteville, N. Y., 1 cock, 1-2 hen.

Lamentable falling off here.

Silver Spangled Hamburg—Frank Swingle, Pittston, Pa., 3-4 cock, 3 hen, 2 pl., 3 old pen; Elmer E. Wert, Gloversville, N. Y., 1 cock, 1 hen, 1 old pen; J. H. Williams, Antwerp, N. Y., 2 cock, 2-4 ckl., 2-4 old pen, 1-3-5 young pen; Arch L. Mayo, Pittston, Pa., 5 cock, 2-4 hen, 5 ckl., 1-3 pl., 4 young pen; Linwood Poultry Yds., 5 hen; H. F. Vierow, Rome, N. Y., 1-3 ckl., 4-5 pl., 2 young pen.

Silver Spangled have the best of it in numbers, with some typey, strongly spangled birds selected for the ribbons.

Golden Spangled Hamburg—Sunnyside Poultry Farm, 1 cock, 3 hen; Daniel C. Bristol, 1-2 hen; Lynn J. Boyson, Rome, N. Y., 1 old pen.

Silver Penciled Hamburg—Linwood Poultry Yds., 2 cock, 2 hen, Sunnyside Poultry Farm, 3 cock, 3 hen; Pleasant View Farm, 1 cock, 1 hen, 1 ckl., 1 pl.

A splendid hen wins first.

Golden Penciled Hamburg—Daniel C. Bristol, 3 cock; Sunnyside Poultry Farm, 2 cock, 2 hen, 1 ckl., 1 pl., 1 old pen; Pleasant View Farm, 1 cock, 1 hen, 2 ckl., 2 pl.

First cock and first and second hens an elegant trio.

White Hamburg—Daniel C. Bristol, 3 cock, 2 hen; Sunnyside Poultry Farm, 1 cock, 3 hen, 1 ckl., 1 pl.; Pleasant View Farm, 2 cock, 1 hen, 2 ckl., 2 pl.

First cock good, others show effects of over cooping.

Black Hamburg—John C. Mitchell, 3 cock, 1 old pen; Fred A. Burnham, Ballston Spa, N. Y., 4 cock, 2-5 hen, 2-4 ckl., 2-3 pl., 1 young pen; Sunnyside Poultry Farm, 2 cock, 1 hen, 1 ckl., 1 pl.; Pleasant View Farm, 1 cock, 3 hen, 3 ckl., 4 pl.; Daniel C. Bristol, 4 hen.

As usual, Blacks make a good showing, with good quality, as always, to be found in this wonderful variety.

W. C. Black Polish—Will J. Kelley, Cambridge Springs, Pa., 1-2 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young pen; Robt. E. Wilhelm, Phillipsburg, N. J., 5 cock, 3-5 hen, 3 ckl., 3-4 pl., 2 young pen; Sunnyside Poultry Farm, 3 cock, 4 hen; John G. Linville, 4 cock.

Some good ones, notably first and second winners in cocks, hens, cockerels and pullets, which have substance of body, large, pure crests, and in the young stuff good development.

Bearded Silver Polish—Sunnyside Poultry Farm, 2 cock, 3 hen, 1 ckl., 1 pl.; Pleasant View Farm, 1 cock, 4 hen, 2 ckl., 2 pl.; John G. Linville, 1-2 hen.

First, second hens, well laced, of good style.

Non-Bearded Silver Polish—Walworth Polish Yds., Ogdensburg, N. Y., 2 cock, 1 hen, 3 ckl., 3 pl.; Sunnyside Poultry Farm, 3 cock, 3 hen, 4 ckl., 5 pl.; John G. Linville, 1 cock, 2-4 hen, 1-2 ckl., 1-4 pl.; Pleasant View Farm, 4 cock, 5 hen, 5 ckl., 2 pl.

Some nice specimens in plain Silvers. The young stuff here especially well developed.

Non-Bearded White Polish—Sunnyside Poultry Farm, 2 cock, 2 hen, 1 old pen; Pleasant View Farm, 1 cock, 1 hen, 1 ckl., 1 pl.; D. E. Sincebaugh & Sons, 3 hen.

Both plain and bearded, representative showing.

Buff Laced Polish—Sunnyside Poultry Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 young pen; Pleasant View Farm, 2 cock, 3 hen; John G. Linville, 2 hen.

Mottled Houdans—Daniel C. Bristol, 2-3 cock; W. F. Bast, Phillipsburg, N. J., 1 cock, 1 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young

high and scarce. Get eggs all the time, even when they moult. Dissolve WACKER'S B. T. G. F. Tablets in all the water they get to drink; then you turn food into eggs instead of all fertilizer. No MEAT OR GREENS ARE NEEDED WHEN USING the tablets; nothing needed for the moult. Results or your money back. C. O. D. orders promptly filled. 600 Tablets, \$1.00; 1,300, \$2.00.

WACKER REMEDY CO.,

Box 157-22, Camden, N. J.

pen; Ina Bailey, Apulia, N. Y., 3 ckl., 3 pl.
First cock and hen, strong pair. First cock-
erel and pullet, uncommonly big, well grown
chickens for September, with a good type.
White Houdan—Sunnyside Poultry Farm,
3 hen, 1 pl.; John G. Linville, 1-2 hen.
Creve Coeur—John T. Bird & Son, 1 cock,
1 hen, 1 ckl., 1 pl.; John G. Linville, 2 cock,
2 hen; Sunnyside Poultry Farm, 3 hen.
La Fleche—John G. Linville, 1 cock, 1 hen.
Silver Campine—J. F. Dix, Jamesville, N.
Y., 1-2 cock, 1 hen, 3 ckl.; Edmund A. Parks,
Jr., Fayetteville, N. Y., 3-4 cock, 1 ckl., 1
young pen; Francis M. Wilson, Williamstown,
Mass., 2-3-4-5 hen, 1-5 ckl., 1-2-3-4-5 pl.; Olin
Snyder, Jamesville, N. Y., 4 ckl.

First cockerel, outstanding; beautiful devel-
opment and type; clean white bar; black full
of green lustre. First to fifth pullets, thrifty,
well put down birds of good quality. Second
hen, our choice over first.

Golden Campine—Thos. O. Perry, Green-
wich, Conn., 1 cock, 1-2 hen; Henry Bau-
mann, Bal'ey Stream, N. Y., 1 ckl., 1 pl.;
Lynn J. Boyson, Rome, N. Y., 1 young pen.
A strong pair of old birds.

Jersey Giant—Francis M. Wilson, 2 cock, 3
hen, 3 young pen; Edw. J. Bieder, Rochester,
N. Y., 5 cock; Wilburtha Poultry Farm, Tren-
ton Jct., N. J., 1-3 cock, 1-4 hen, 1-2-3 ckl.,
1-3-4-5 pl., 1 old pen, 2 young pen; Farm
Produce Stores Corp., 4 cock; Fred M. Rowe,
Avon, N. Y., 2 hen; Homestead Farm, Yar-
mouthport, Mass., 5 hen; C. S. Milhiser,
Sauquoit, N. Y., 5 ckl.; F. W. Spalding,
Poultney, Vt., 2 pl., 1 young pen; W. B.
Coughtry, Delmar, N. Y., 2 old pen.

No breed in the show had a better repre-
sentation of big, heavy bodied, sturdy young
stock. There appears no question about the
size and ability to grow being inherent in this
breed.

Buttercup—R. J. LaLone, Potsdam, N. Y.,
3-5 cock, 2-3-4 hen, 4 ckl., 1 pl., 2 young pen;
J. L. Thomas, Binghamton, N. Y., 1-4 cock,
2-3 ckl., 1 young pen; Paul Abbott, Marcellus,
N. Y., 2 cock, 5 hen, 2-4-5 pl.; Chas. J.
Lieber, 1 hen, 1 ckl., 3 pl.

Cass not as big as some years. Males show
uniformity of color, but females are not as
uniform in markings as they should be.

Put Yourself in This Man's Place

"What made Jim Taylor late for supper?"

Mrs. Taylor was worried. Jim was seldom late for supper. Finally, she heard hur-
ried footsteps, and Jim burst in: "Couldn't help it, Polly—just couldn't help," said Jim,
as he put the bank book on the table, "we're going to have the new poultry house this
winter; I've just paid off the mortgage and bought lumber for the new building, and
see"—as he opened the bank book—"we still have \$2100 in the bank."

"Just think, Jim," said Mrs. Taylor, "the chickens, and the National Poultry Insti-
tute did it all. It doesn't seem possible that two years ago you were working for some
one else, and now we have our own home and poultry plant."

"Twas a lucky day, Polly, when I sent for The National Poultry Institute's free book,
'How to Raise Poultry for Profit,'" said Jim.

There are many "Jim Taylors" who owe their success to The National Poultry Insti-
tute. "All our neighbors are talking about our wonderful success," writes Miss Ida Haun,
of Montezuma, Indiana. "From my last hatch I never lost a chick, and as for eggs, we
get more now than we ever did before; I am surely satisfied with your Poultry Farming
Course."

"Would not take \$1,000 for what I learned from your course," says Mr. Louis M.
Wright, Federalsburg, Md., and Mr. Arthur Pearson, of Chauncy, N. Y., writes: "I have
gained hundreds of dollars which I would have lost through ignorance had I not taken
your course."

I have more than doubled my egg production by following your methods," writes Mr.
William Hirst, Maple Shade, N. J.

Letters like these are coming from all States of the Union and from
many foreign countries. SUCCESS is the keynote of all of them. YOU
CAN RAISE POULTRY FOR PROFIT as easily and as quickly as others
are doing. Our thorough, practical Poultry Correspondence Course will
SHOW YOU HOW.

NOW IS THE TIME FOR YOU. THE BIG SEASON IS HERE.
Put yourself in Jim Taylor's place. Send for the new free book, "HOW
TO RAISE POULTRY FOR PROFIT." Do it! The book is free, but
it contains the key to your future SUCCESS. Send today, NOW.

FIRST PULLET NEW YORK 1922

Follow "The FUL-O-PEP Way"

In Preparing Your Pullets

For Winter Production

The success that has been attained by the many thousands of poultry-men who have adopted "The Ful-O-Pep Way" of raising poultry is undisputable proof of the fact that "The Ful-O-Pep Way" makes poultry pay.

"The Ful-O-Pep Way" of preparing pullets for Winter production is covered in this advice; watch the condition of your birds; watch their condition of flesh—if they are thin feed them heavily on Ful-O-Pep Scratch Grains; if they are getting too fat increase the amount of Ful-O-Pep Dry Mash. By adjusting the relative amounts of these two feeds it is possible to keep the pullets in just the right flesh to lay heavily throughout the winter and still be in condition to continue to lay well during next spring and summer.

Feed Your Birds For All-Year-Round Production

Poultry keeping is a business that lasts the full twelve months. "The Ful-O-Pep Way" provides for all-year-round production. Ful-O-Pep Feeds are just right to keep the birds in the best condition *all the time* and the feed that keeps the birds laying throughout the year is the

feed that produces the profit. Follow "The Ful-O-Pep Way"—keep the Ful-O-Pep calendar handy for ready reference, if you haven't one write for it. It's free for the asking and by following the simple practical advice contained therein month by month—your success with poultry is assured.

St. John's Poultry Farm,
Breeders for Egg Production
Oronogo, Mo.

The Quaker Oats Co., Chicago.

Here are some photographs that we believe is the best evidence we could give you of the splendid results we are obtaining with Ful-O-Pep Feeds.

The bunch of chicks in the smaller picture were one month old when picture was taken. The larger picture is of our growing stock 2½ to 3 months old—all raised "The Ful-O-Pep Way."

POULTRY SERVICE DEPT. APJ CHICAGO, U.S.A.

Follow "The FUL-O-PEP Way"

In Preparing The Breeders For Good Hatches Next Spring

When a master breeder such as W. D. Holterman follows "The Ful-O-Pep Way" in producing his Aristocrat Barred Rocks it is pretty good proof that it will also prove profitable to you.

Preparing the breeders for good hatches next spring depends upon good feeding NOW. In order to have the birds produce the strongest chicks next spring they should take a rest in October and November. Decrease the Ful-O-Pep Dry Mash and increase Ful-O-Pep Scratch Grains. This will stop them laying and get them in condition to do their best when eggs count during the hatching season.

Push the Layers With Ful-O-Pep Dry Mash

The hens that are kept as layers and not as breeders should be hastened through the moult and got to laying again. Feed Ful-O-Pep Dry Mash and Ful-O-Pep Growing Mash half and half; this hastens the moult. When through moulting keep the Ful-O-Pep Dry Mash before them all the time; the more mash the more eggs. The "Ful-O-Pep Way" enables you to get maximum production from your hens during the winter.

Ful-O-Pep Dry Mash contains a variety of proteins, the Oatmeal and Alfalfa Meal is just the right combination to keep them in best of health—lowest mortality and highest production throughout year. Follow the "Ful-O-Pep Way" for year-round profits. Your dealer can supply you with Ful-O-Pep Feeds.

An "Aristocrat"
Barred Rock
Male in
All His
Stately
Glory

Mr. W. D. HOLTERMAN says in his 1922 Catalog:

"Now for feeding Aristocrat Barred Rocks, so as to get best results the year round, my sincere advice to my customers is to write to the Quaker Oats Co., Chicago, for their booklet on feeding. They will send it to you FREE—especially if you tell them Holterman told you to write for it. Follow their plan; this is simple and is explained so clearly that anyone can carry it out. Thus far in all my years as a breeder I have found this to be the most satisfactory way to get results."

The Quaker Oats Company
POULTRY SERVICE DEPT. APJ CHICAGO, U.S.A.

NOX-A-MITE**Powerful Disinfectant
in White Powder Form****Deodorizer — Louse Powder**

NOX-A-MITE when mixed with water and sprayed or spread on everything in the poultry house from floor to ceiling, will destroy mites, nits, and drive away lice and other vermin. Sprinkled dry on nests and droppings, will, at a trifling cost, disinfect and sweeten your poultry house. Sprinkled dry on fowls, **NOX-A-MITE** drives away mites and lice and saves the lives of many of your choicest chicks.

NOX-A-MITE will not scale or peel off. Can be used freely, owing to its low cost. One pound mixed with one gallon of water will go farther and do more good than ten dollars worth of the high priced lice killers now on the market.

NOX-A-MITE destroys in one operation, through the simple process of spraying poultry house, the greatest pests and drawback to the raising of poultry.

ORDER DIRECT from this ad today. You take no chances, no risk whatever. Money refunded if not all we claim.

PRICES PREPAID: 10 lbs. \$1.25; 25 lbs. \$3.00; 50 lbs. \$5.50; 100 lbs. \$10.00. 25% extra in Rocky Mountains and west.

MRS. ELY BROYLES, Carrollton, Mo.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

The ceremony of dedicating the monument to the original Delicious tree was carried out at Winterset, Iowa, August 15th, before one of the most notable gatherings that ever attended an event of this kind. Leaders in horticulture, pomology, and publishing fields attended the dedication, not only from many parts of the United States, but from Canada. Thousands from Madison and surrounding counties joined in the celebration. The monument was erected by the Iowa Horticultural Society, Madison County Historical Society, and the Iowa State Historical Department. W. P. Dawson, president of the Iowa State Horticultural Society, presented the monument and it was accepted on behalf of the state by E. R. Harlan, State curator. Prof. C. I. Lewis, formerly director of the Oregon Experiment Station and now managing editor of the American Fruit Grower Magazine; Paul C. Stark, Vice-President of the American Pomological Society, and others, spoke at the dedication. Prof. C. P. Close, United States Pomologist from Washington, D. C., spoke, giving an appreciation of this 50-year-old tree which is still bearing good crops of Delicious apples.

In 1872 Jesse Hiatt found growing on a small farm near Peru, Iowa, a seedling apple tree. Mr. Hiatt was an enthusiastic horticulturist and very tenderly he cared for this tree. I have heard him tell how he watched the growth and development of this seedling.

In 1893 Mr. Hiatt sent specimens of this new apple to Stark Bros. Nurseries and Orchard Company, Louisiana, Missouri. Stark Brothers found this apple to be the best in quality and the most handsome of any specimens ever sent them. In 1894 Stark Brothers' Nurseries and Orchard Company introduced this apple, having registered it under the name of "Delicious." It is today the Standard of Perfection by which all other apples are judged. It is now growing in every section of the United States and

Canada and in many foreign countries. It demands the highest price in all the markets of the world. It is a most satisfactory apple tree so far as hardiness and adaptability to all climatic and soil conditions are concerned.

The introduction and popularizing of the Delicious apple involved an expenditure of over three-fourths of a million dollars by Stark Brothers Nurseries and Orchard Company. Paul C. Stark tells me that the company's books show that since 1895 they have sent out 7,950,000 Delicious apple trees. Those who secured the Delicious trees early after this introduction, and made orchard plantings of same, have reaped a very rich reward. It is today the most profitable apple the orchardist can produce and the world owes Stark Brothers Nurseries and Orchard Company a very large debt of gratitude for the introduction of this unequalled apple.

I want to plant some peach seed. When is good time to plant? How do I plant them for transplanting? That is, how close in drill and how deep in ground? I have 80 acres I want to put out in peaches if I can get good healthy sprouts from seed well planted. My soil is a mixed yellow clay and sand with a white clay foundation.

Louisiana.

J. E. Noble.

The best time for you to plant peach pits is during the month of October. Plant the pits about 8 inches apart in rows, the rows 3 feet apart. Next season bud these trees to the varieties of peaches you desire in your commercial orchard. Later, plant trees in their permanent location.

Can wild gooseberries and raspberries be transplanted in rows and bear as well as the tame berries?

Montana.

J. W. Woodstock.

The wild gooseberry and raspberry can be transplanted and will bear fruit. But why do this when you can as easily raise the better and more profitable tame fruits?

My blackberries have leaf rust so bad that for the last twelve years I have not been

The monument to the Delicious apple, and leading horticulturists of United States and Canada.

The "SUCCESSFUL" Sprouter Self-Paying In 10 to 14 Days Through Increased Egg Yield and Decreased Feeding Cost

Lower Your Feed Bill

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service. Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1923 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" GRAIN SPROUTER

Practically All Steel—Made In Sections
With New Safety Lamp—Safe in Any Part of House or Barn

Double steel walls—metal trays. Cannot be compared to wooden sprouters. Warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold. Glass doors. Each section a separate compartment. Start with enough sections for your needs and add more as you need them. Here is a money maker. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day increases the egg yield, cuts feed cost one-third. Write for full details. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cts. Write today.

Stop Hatching Weak and Wobbly Chicks!

(57)

With Cheap Incubators

Remember, it is not how many you hatch out that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

**Hatch Strong, Healthy
Chicks that Live and Grow**

We receive many letters such as the following from one of our Illinois dealers: "We have handled the Queen Incubators and Brooders for the past ten years, selling our first machine Feb. 28th, 1912, and up to the present time we have disposed of 226 machines, all of which are giving the best of satisfaction, even to quite a number of the older ones which are still in service."

Sizes:
70-Egg to
1000-Egg

Start Your Chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is **cheap in the long run**. It will be turning out high percentage hatches years after the cheap machines have been junked. Sold by dealers. Catalog sent on request.

QUEEN INCUBATOR CO.,

able to get a taste of fruit. What shall I do?

Missouri.

Mrs. Gordon Van Dett.

If you will spray your blackberry plants with Scalecide each fall and spring while vines are dormant and again in the spring before growth starts, then several times during the season with Pyrox, you will have no trouble with blight or any disease or insect injury to vines or fruit. These spray materials can be secured of any seed house or dealer in horticultural supplies.

* * *

I would like some information in regard to planting about four acres to a commercial orchard of apples and peaches. Will you kindly tell me the kind of apples and peaches that I should plant?

Indiana.

J. W. Opel.

Advise you to plant Delicious, Golden Delicious, Stayman and Senator apples.

* * *

We bought an 18-acre farm and moved here from Baltimore this spring. Have had some stiff sailing, but the first few years are always lean ones. Have two acres of berries and shipped the crop to Pittsburgh. They helped a lot. Am building a 60-foot house after the plan of G. E. Stillwagon in the June A. P. J., and expect to get 800 White Leghorns next spring. We have a row of about 30 currant bushes and shipped about 10 quarts to fill out a raspberry crate and got same price as other crates. Do currants usually sell high in Pittsburgh? We have a sandy loam with clay subsoil; currants and berries seem to do well here. Am thinking of setting out some more. 1. Can you set out new bushes from these old ones, and how do you do it? 2. Where could I get new bushes and about what price? 3. Do you plant in spring or fall? 4. The bushes here are too close. Could I thin out every other bush and replant them, and what time should it be done? 5. Do you think bees would do well here? 6. What varieties of apples would you recommend that I plant?

Maryland.

M. K. Holden.

Currants are a very profitable crop. They command a good price in the Pittsburgh market. Why not develop a home market for this and other fruit? (1) To propagate the currants, take cuttings in the fall. Use only cuttings of the current year's growth. Plant these in rows far enough apart so they can be cultivated next season. Place cuttings about six inches apart. One year from this planting set the young plants where they are to permanently remain. (2) New plants can be secured from any nurseryman at \$5 to \$15 for 100 plants. (3) Plant in fall. (4) Yes, in fall, dividing each large plant. (5) Yes, bees would be very profitable if you will properly care for them. (6) Delicious, Golden Delicious, Stayman and Johnson's Winter.

* * *

I am very much interested in a statement you make about the land of the sky, North Carolina. I am 50 years old and in the course of a few years I hope to leave my job to settle in some nice locality. I have traveled over the United States quite a lot, as it has been of some benefit to my health. I have an idea of taking a short vacation in North Carolina to see the district. What apple does the best there?

Ontario, Canada.

J. H. Warden.

You will find the "Land of the Sky" in North Carolina a wonderfully beautiful and healthful section. Asheville is the chief city. The Stayman apple is at its best in this section. Advise you to plant this variety. Also Delicious and Golden Delicious.

* * *

Can you tell me something about the Puget Sound country of Washington State? Is this a good fruit country, and what will good fruit land cost? I am interested in the Skagit valley and Vashon country in particular. Do you consider this as good a section as Oregon for fruit?

Maine.

I. H. Proctor.

The Puget Sound country is a favor-

Wipe Out Every Rat and Mouse

Amazing Discovery Quickly Kills Them All—Not a Poison

Rats, Mice, Gophers,—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. The original, time-tested Danyz, fluid true Virus. Entirely harmless to humans, poultry, stocks, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside, hunting air and water. Imperial Virus is put up in sealed bottles, guaranteed to retain full strength and potency. Only safe and sanitary method to overcome these pests. Indorsed by more than 60,000 users, including Farm Bureau Experts, numerous factories and large, nationally known institutions.

LICE and MITE REMEDY FREE

Send no money.—Just your name and address, to Imperial Laboratories, Dept. 8040, Kansas City, Mo., and they will send you a regular \$1.00 (double strength) bottle of Imperial Virus, and will also include, free of charge, a full-sized \$1.00 bottle of Imperial Lice and Mite Remedy, enough for average flock. Pay the postman only \$1.00 and a few cents postage when the package containing the \$2.00 worth of remedies arrives.

Poultry raisers can easily and quickly clean out Lice and Mites by means of Imperial Lice and Mite Remedy. Occasionally put a few drops of this remarkable remedy in the fowl's drinking water. It renders all Poultry, including Hens and Chicks, immune and free from all blood-sucking parasites. It is also a splendid Tonic and Blood Purifier, and increases egg production. Positively guaranteed not to affect meat or eggs.

NOTE—Readers risk no money in accepting the above offer, as the Imperial Laboratories are fully responsible and, on your request, will refund your \$1.00 any time within 30 days, if you are not entirely satisfied with the results obtained from either remedy.—Advertisement.

World's
Foremost
Poultry
Feeding
Secrets

Greatest Book on Feeds and Feeding Ever Published

If you need more money, if you want to make your hens lay more eggs this winter than ever before; if you want to learn about the most successful feeding methods for poultry of all ages, ascertained after years of experimenting on the part of our best breeders and poultry experts; the best feeding formulas used by the leading agricultural colleges in America; a formula for a standard egg producer that will turn any kind of hens, old, young, mongrels or purebreds into veritable egg machines; and a great mass of other valuable information on feeds and feeding—then you must have a copy of the "World's Foremost Poultry Feeding Secrets."

The one chapter giving a recipe for the Standard Egg Producer is alone worth many times a dollar, what the book sold for last season.

50 Scrub Gulls Produce 35 Eggs Per Day

To ascertain the effectiveness of the Standard Egg Producer the Standard Poultry Company of San Antonio, Texas, purchased fifty very low class mongrels, ages 2 to 4 years. The hens looked as though egg production were an impossibility with them.

"When we began feeding Standard Egg Producer," reports the Standard Poultry Co., "they were not laying—not even one egg a day. In eighteen days after feeding them the Egg Producer they began laying, and at the end of six weeks, their daily average was 35 eggs. They held this high average until we sold them, several months later. We have tested the egg producer with purebreds and with mongrels and in every case it produced a surprising increase in egg production." Illustration shows actual results before and after feeding Standard Egg Producer.

Standard Egg Producer Makes Any Class of Hens Lay in Any Season

The Standard Egg Producer is a respecter of no class of hens or seasons of the year. It will make scrubs lay in the winter just the same as purebreds in the spring. If used in connection with artificial light, the high egg yield would almost stagger the most skeptical.

Western Poultry Journal

Published monthly, 50c year; 3 years, \$1.00. The magazine is so good that every reader of this paper will want it. Contains exact information the practical every day poultry raiser and beginner is hungry for but which is so often sadly lacking. Practical and scientific poultry experts guide you through every step in poultry raising from egg to show-room or market. The book and magazine should help you make a wonderful success. Don't lay this advertisement aside; but take out your dollar bill right now, pin it to the coupon, sign, and mail at our risk and get the Western Poultry Journal every month for three years and the book free.

Science Discovers Best Lice Remover

Changes Old Methods—No Dusting or
Spraying—Birds Delouse Themselves.
Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice remover keeps the birds always free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice-Go, which is the name of this sensational lice remedy, is added to the drinking water. The medicine taken into the system of the bird comes out through the oil glands of the skin and every louse or mite leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice-Go will remove every louse or mite, that he is making a special guaranteed offer of a regular full sized, double strength, \$1.00 package of Lice-Go and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co. Dept. 303, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after 30 days trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

AIR FRICTION CARBURETOR CO.
Department 3504 Dayton, Ohio

able one for the production of small fruits. Apples are not largely grown, commercially. Oregon presents better advantages in the way of commercial apple production than does the Puget Sound section. Write to the Chambers of Commerce, Seattle, Washington, and Hood River, Oregon, for information.

* * *

Can you give me any information of the land around Brownsville, Haywood county, Tenn.? Is it adapted to fruit, vegetables and poultry? The land is gently rolling, light, sandy loam with clay subsoil. Would a combination farm as above pay in this section. Are the markets good there? It is on the Louisville & Nashville railroad, 57 miles from Memphis.

Wisconsin.

Sam Brugger.

The location to which you refer is well adapted to the profitable growing of fruits, vegetables and poultry. A combination fruit and poultry farm, properly conducted, should prove to be a money maker. Markets are good and available.

* * *

Which is the better location for a poultry farm, around St. Louis or close to Colorado Springs, Colo.? Is it any colder at Colorado Springs? Which is the better market the year around for poultry and eggs? At which place is the price of land cheaper? If close to St. Louis, would not want closer than thirty miles, at some good town, but I do not know anything about Colorado Springs, as I have never been there.

I would want a place with fruit. We also have several thoroughbred spotted Poland-China sows and would like to get close to a stock yard so we could run our hogs into the market in a truck and thereby get the highest prices? We expect to have about 2000 hens. Have S. C. White Leghorns and Barred Rocks. Can not do much here, only getting a good foundation built up so that when we get close to a good market I can in one season increase to the numbers that we want to carry. We expect to keep a few cows, but just what we need to supply our chickens with milk. I will greatly appreciate any information you may give me.

Which of the two places is the better for raising chickens? Also more healthy to live? I thought maybe the tourists at Colorado Springs would make a better market for eggs in spring and summer than St. Louis. Do you know what price they get out there? Is the land level around Colorado Springs. I will have to get close to good schools.

Missouri.

D. M. Githens.

There are many advantages in each of the sections you name and one cannot well balance one against the other. For a poultry farm, with fruit, cows and hogs on the side, I unhesitatingly recommend that you settle near to St. Louis. You may be able to buy a fruit-set piece of land near either city you name. St. Louis will afford you a market every day in the year for your eggs, market poultry, dairy products and other products raised. The St. Louis market is far better than the Colorado Springs market. When you ask which is the better climate I am dumb. Climate is a matter of personal choice.

* * *

I saw an advertisement in the Southern Planter in which you said Mustang was a sure remedy for roup and gapes, and that you have been using it for 24 years. How do you treat them with it? My chicks always have the gapes by the time they are 3 weeks old.

Virginia.

Mrs. M. C. Fallen.

I have never said that Mustang Liniment was a sure cure for gapes in chicks. I have used it with good results. Swab the throat of the chick with a cotton stick, applying the liniment on the cotton, or place a drop of the liniment in the chick's mouth.

Our Cover

The male depicted on the cover this month is a Single Comb Rhode Island Red. In order to encourage this substantial body type, pullet weight has been increased to 5½ lbs.

Caught Shorthanded

We'll admit it. We only had half enough chicks and hatching eggs the past season to fill the host of orders that came to us for World's Champion Layers. Result: Good friends of ours unavailably disappointed.

Help us to help you

next year. We have a plan that will enable us to gauge in advance just how far our limited supply of Consistent Contest Winners will go. Any poultryman who desires to assure getting this superior-profit stock and at the same time enjoy a big price advantage on his next Spring's orders, should write us at once for our new 16-Day Sale Circular, which outlines this plan and also lists some fine Bargains from our World's Champion Layers—that wide-awake poultrymen are going to snap up quickly, right now.

Pennsylvania Poultry Farms

Kentucky Experiment Station Approves Semi-Solid Buttermilk

Prof. J. H. Martin of the Kentucky Agri. Experiment Station, says Semi-Solid Buttermilk, sour skim milk, or buttermilk supplemented by home grown grains, gives maximum egg production at least cost per dozen. This test officially confirms the testimonials of thousands of poultrymen, that the flock fed Semi-Solid and home grown grains exclusively is the most profitable. Buy an introductory order of Semi-Solid and prove these facts yourself.

Semi-Solid Buttermilk

is extensively used by leading poultrymen in every State. It is pure creamy buttermilk, pasteurized and condensed to point of maximum feeding value per pound. Containers range from one gallon to 500 pounds, and meet the needs of every flock.

Write for FREE Book Today

Write today for complete report of Prof. Martin's sensational test, also Prof. Harry L. Lewis' book "Buttermilk Fed Chicks," which shows superiority of Semi-Solid Buttermilk from the brooder to the laying hen. Every poultryman reads and profits by the advice of these famous poultry experts. Send for your copy TODAY. Fill out coupon NOW!

SMOKE-EM
CANNED SMOKE

"SMOKE 'EM," THE GUARANTEED ROUP CURE.
A discovery of the world's best known home of Registered Livestock and Trapped Leghorns. The loss of thousands of dollars worth of our valuable fowls each year from roup, colds, canker, diptheria, and chicken-pox either meant the discontinuation of our poultry department or to discover a genuine cure. Now our losses have absolutely discontinued. Over two hundred thousand poultrymen and farmers throughout the United States and Canada use and recommend "SMOKE 'EM," the most scientific DRUG-ESS CURE that ever has been discovered. Inexpensive and easy to use. Eliminates the slow method of vaccination and injections of serums as preventives. Every cent of your money back if it fails. Used extensively in California where every remedy is analyzed and closely scrutinized by the State Board of Health. Any remedy or preparation used in California must have genuine merits. Two hundred thousand testimonials on file at our office. Read what, I. Polley, of Baker, Oregon, says: "I used 'SMOKE 'EM' on a number of chickens whose eyes were swollen shut, mouth full of canker and they had that terrible roup odor, on the third day they began to improve and drink water, the fourth day they began to eat and on the seventh day they began to sing and lay. I surely cured them with 'SMOKE 'EM,' your genuine cure for roup, and we will never be without it."

W. E. Jackson, Berryville, Virginia, writes: "The 'SMOKE 'EM' I bought of you last fall certainly did the work, it is the best thing I have ever seen for Roup and Colds in poultry. My birds were in such a condition that I thought I would never get them well, but, after smoking them with 'SMOKE 'EM' they came around alright. Thanking you for putting such a cure on the market."

Emil Seib, Poseyville, Indiana, R. R. No. 2, writes: "I want to let you know about our chickens. They had been sick a few months ago, and we thought half of the flock would die. Eight of them died within a few hours. So we gave our chickens a good dose of 'SMOKE 'EM' in the morning, and the next morning they were alright. So I don't think anything else could have cured them quicker and better than your 'SMOKE 'EM'."

E. T. O'Neal, Secretary, Board of Education, District 7, Hurst-Bush School, Hurst, Illinois, writes us: "I tried 'SMOKE 'EM' last year and find it a better success than anything I ever tried. I had come to the conclusion there was no positive cure for roup, but 'SMOKE 'EM' will do the business."

T. A. Hall, Milford, Delaware, writes: "I have been advised by a friend of mine, Mr. Edward Passwaters, Hartley, Delaware, to try your roup remedy, 'SMOKE 'EM,' canned smoke, as 'SMOKE 'EM' cured Mr. Passwaters' fowls. The State furnished me with serum for vaccination and it is not checked yet, and as I have a very bad case of roup will appreciate your sending me 'SMOKE 'EM' at once, as I have faith in it."

You owe it to yourself and to your poultry to write or wire for our large catalog and full information today. The price is low. Dealers, we have a good proposition to offer you.

October Work in the Poultry Yard

By Otto E. Hackman

October is one of the really important months in the poultry world. This month finds the young stock pretty well matured and showing the stuff of which they are made. The singing of the early pullets and the reddening and developing of the combs are all good indications of a supply of fresh eggs next winter. These indications are a delight to the poultryman—beginners especially—that cannot be described. We are all eager and on the lookout for the first pullet eggs.

The selecting of our winter flock of profit producers should not be put off longer. We cannot house and feed all the pullets and hens, the good and bad alike, with justice to the flock and the maximum profit to ourselves. In every flock there are always more or less undesirable, or "wasters." These bring in no profit, are a constant loss to the owner, and pull down the good showing made by the better birds. It should be the duty of every poultryman to find these specimens and get rid of them at the earliest opportunity. By disposing of them at once, the feed bill will be cut down, the profits increased, and more room provided for the birds that are doing their share of keeping money in the pockets of the owners.

It is most generally the case that when the young stock is of good size and makes a good appearance as a whole, the owner dislikes to sacrifice any of the birds, although he knows certain individuals are lacking in size and vigor and are not fit to enter the breeding pens later, or that will lay sufficient eggs to make the time and trouble taken to care for them worth while. It always pays, in time, money and satisfaction to dispose of all undesirable just as soon as they are known to be such. In any event, the culling out of the drones should be done before the stock is put in winter quarters.

The cockerels, especially, should be culled often and closely. All those that appear deficient in vigor or that show any serious disqualification marks, should be culled out and marketed. Deficiency in vigor can easily be detected by the birds' actions and build. The listless, cowardly specimens are the weaker ones. And those that have crow heads, or "snaky" heads, and narrow across back and shoulders, are the ones that are inferior from a breeding standpoint. All such should be culled out at the earliest opportunity.

Some breeders resume hatching in September. Although this extremely late hatching does not always prove profitable, yet if one has failed in obtaining the number of chicks desired earlier in the season he must resort to late hatching. However, some consider hatching at this time more conducive to good results than hatching in June. If the male birds were removed when the hatching operations ceased in June, and were not replaced until August it is likely they will be in good physical condition to produce vigorous, livable chicks. These chicks will prove profitable layers next spring.

These late hatched chicks must be kept growing every day from the time they leave the shell if they are to develop properly, that much is sure. They must attain good size and be fully feathered out before really cold weather sets in. They must have no setback. Unless they are kept growing right along they will become stunted and develop into runts at best.

These late chicks should be kept away from the earlier hatched ones. They must be kept by themselves, on a fresh plot of ground, and fed separately. To attempt to raise these chicks on the same plot of ground that the earlier chicks were raised on—ground that has become saturated with droppings, and therefore poisoned—is suicidal. And if they were fed with the older chicks, they would be picked on and knocked about, and deprived of the proper share of food.

It is advisable to keep the chicks confined in the early morning until the grass has dried off, especially if the grass is permitted to grow long around the brood coops. If the grass is kept clipped short however, no harm is likely to result if the chicks are permitted to run out. When they are confined at night and the owner cannot be there early in the morning to feed them, it is advisable to place the water vessels and a little feed inside the coops so they can help themselves as soon as it becomes light enough to see. At any rate, it is a good plan to have slat doors to all coops, with the slats close enough together to keep out cats and other prowlers, which are likely to make off with some of the chicks during the night.

All chicks should be roosting at this sea-

BROOD YOUR CHICKS 30 DAYS FREE

Don't miss this opportunity. Brood chicks during cold weather without loss or trouble. Use **Simplex Brooder Stove**. A wonder for simplicity, dependability and success. It is different. Better. Safe and sure. Chicks thrive under its radiant heat. No hovers to bother with. **No Gas. No fumes. No wicks. No smoke. Self regulating.** Saves worry, bother, work, time and money. Successfully raises 20 to 50 per cent more chicks. Ventilates as it heats. No more deaths from white diarrhoea or poor ventilation. Chicks always healthy and hardy. It's the brooder you have been looking for.

30 Days Trial!

Judge the Simplex Brooder Stove yourself. See what splendid success you'll have. **You run no risks.** If it doesn't fulfill absolutely every claim we make for it, return at our expense and we refund money in full. We know you'll like the Simplex. One trial will convince you of its superiority and dependability. Thousands use it.

TURN LOSS INTO PROFITS

Simplex soon pays for itself in economical operation and additional chicks raised. "Is a perfect jewel" says Miss Ada Klotz, Mo. "Have used for seven years with perfect results" writes Jonal Mills, Ind. Have used several makes, but Simplex beats them all" according to Senger & Parrhall, N. Y. Many other similar testimonials. Write for fully illustrated booklet. Mailed to you FREE. Send for it tonight. Learn about free trial offer Address

SIMPLEX BROODER STOVE CO.
P. O. Box 3010 Grand Rapids, Mich.

Simplex stove made in three sizes. Capacity 200-500-1500 chicks

Gives chicks even temperature, plenty of fresh air, large radiation area. Gives ample room for exercise.

son. I consider from eight to ten weeks the proper age for chicks to roost. They can be kept cooler when on the roost than when permitted to crowd together on the floor of the brood coops. This they will do no matter how uncomfortable they are. And nothing is more disastrous to proper development than overcrowding and overheating. While on the roost the air will circulate around and beneath them freely, thus tending to keep them more comfortable. Do not have the roosts too narrow for young chicks. Narrow roosts cause crooked breast bones. Have the roosts about four or five inches wide and from a foot to two feet from the floor. If the chicks will not roost of their own accord, place them on the roosts a few times after dark and they will soon know what is required of them.

Colds and Contaminated Ground

Wm. Rodman, Minnesota, writes: "Referring to the article in the Journal entitled 'Healthy Land Underlies Healthy Poultry,' written by W. C. Thompson, in which he mentions the use of lime on land before plowing, would like to know how much lime to use and what is the best time of the year to use the lime and plow the land."

"I have had much trouble in my flock with what appears to be a cold in the head and with running at the nostrils and sometimes it develops into roup. These colds seem to commence when the chicks are about three months of age and although I doctor them and take them away from the rest of the flock it seems to run through the flock of chicks and makes me lot of trouble."

"Last year was the worst one I ever experienced in that respect and I lost a number of fowls and it also stunted the growth of many of them."

"My yards are flat with black loam top soil, and clay and gravel subsoil. My yards have been used for ten years without plowing them up."

"Would you do me the favor to forward this letter to Mr. Thompson and have him write me what to do in the matter and I will be pleased to do the right thing."

Professor Thompson, head of the poultry work at the New Jersey Agricultural College, replies: "At the request of Mr. Platt, I am writing you regarding the liming of soil looking toward the discouraging of worm eggs and sanitation in general. While we have not had an opportunity to attempt extensive experiments along this line, we are more or less convinced that application of hydrated lime at the rate of 1 1/2 to 2 tons per acre will be necessary in order to rid the over-used poultry soil of such infestation. It can be done either in the fall or spring. The lime should be spread uniformly over the soil and then the whole ploughed deeply. I believe that inasmuch as your soil is apparently overused, that this treatment will help considerably to renovate and control the situation which has troubled you."

Poultry at Ohio State Fair

By A. H. Emch

Ohio opened the State Fair season for 1922 at Columbus, Aug. 28 to Sept. 2, a record-breaking entry in practically all departments, the poultry department being one of the leading, if not the leader. About 4,000 birds were on exhibition. Great credit is due to Superintendent W. S. Limes, who took hold of this department eight years ago, when there were only about a thousand birds shown, and since has, year after year, improved it. The 1922 exhibit was by far the best arranged poultry show ever held at the Ohio State Fair.

We have visited this fair for a number of years and have met two or three people who would like to see a change in the management of the poultry department. The criticism does not come from the exhibitors, but from some who simply stand around with their hands in their pockets and wag their tongues.

The judges this year were H. A. Pickett, Walter C. Young, Richard Oke and A. H. Emch.

Some very good birds were shown in a number of classes. Anconas, White and Buff Leghorns, Barred Rocks and Reds being the largest classes. The surprise in the Barred Rock alley was so many more Dark Barred females than standard or exhibition females.

There were 22 Dark pullets shown and only six exhibition pullets in the class. The first Dark pullet was considered by some to be entitled to win the special for best pullet in the American class, but the judges took the

stand that the Dark or cockerel-bred females were not in the Standard, so they could not award the special to her. One can always find extra good Partridge Wyandottes at the Ohio State Fair. First cock (Kraner) easily won special for best male in the American class. Some very good cockerels and pullets were also shown.

Special for best hen in American class went to 1st White Rock hen, Best cockerel to 1st. S. C. Red Cockerel, Best pullet to 1st S. C. Red pullet. They were fine birds. In Reds we personally admired 1st and 2nd R. C. Red pullets, fine size and good type and color. They had that broad, smooth, nicely webbed out feather in back and fluff. How much more beautiful it is than the long, stringy, narrow feather. There was a fine class of Silver Wyandottes; 1st cockerel and pullet were standouts. This grand old breed seems to be coming back. White Wyandotte class brought out some grand birds, a number of cockerels and pullets up to weight and shown in extra fine condition in the Asiatic class, the first Black Langshan cock attracted a great deal of attention and won special for best male in the Asiatic class.

Brown Leghorns contained a number of high class birds. White Leghorns were a much better class than last year, shown by a good bunch of fanciers who were ready to say a good word for their competitors' birds if they showed quality; and you could always find a bunch of fanciers in the White Leghorn aisle discussing the fine quality of the birds. First cock, hen and pullet were the stars of the class, the hen being best ever shown at the Ohio State Fair.

The State meet of the S. C. Buff Leghorn Club brought out an extra fine class. The first cockerel was by far the best shaped bird ever shown at this fair and considered one of the very best Buff Leghorns ever shown anywhere, winning the Special for best male in the entire show. He was finished and in winter show condition, nice soft buff color, with a little smoke in tail. Anconas brought out the largest class in the show and competition was strong in all the classes from cock to pens, first pullet being the star of this class and won special for best female in the entire show. A few Black Giants were shown. A "19 pound" Black Giant Capon attracted a great deal of attention from the farmers. There were also a few Jersey Blue Giants shown. Seems as though new breeds are made over night.

Were the Chicks Started Right?

Many persons think that after the chicks have been hatched they can do without the brooder and need little or no attention. This is where a big mistake is made and small, weak, poorly feathered chickens at this season are testimony of poor care in feeding, housing, and general management last spring and summer and you cannot expect to raise a flock of birds that will be up to standard weight and win at the shows if your methods of management result in poor, little, weak chickens. To keep the young birds growing right from the start, you must feed and care for the flock properly. I have a flock of Rhode Island Reds, that are now right and when 8 to 10 weeks old they weighed 2 to 2 1/2 pounds.

I have an Ancona cockerel that commenced crowing at 32 days old. In 1921 I had a cockerel, a larger breed, that commenced crowing at 47 days of age. I started in my back yard 253 chicks this past season. I sold from my incubator \$24 worth of 1 day old chicks.

Geo. Swisher.

Ancona Pullets Lay Early

Last March I purchased twenty-five Single Comb Ancona chicks and raised them all under two Rhode Island Red hens. These chicks were hatched on March 14th or 15th. Out of the 24 chicks I got fifteen pullets and on Sunday, July 23rd two of these pullets laid their first egg, four months and nine days after hatching. I believe this is a record for even Anconas which are well known as early layers.

All my pullets are well developed but have not until this week been fed anything but growing mash, scratch food and green food. This week I started them on laying mash, so expect to have most of them laying in a short time.

D. M. Callaghan.

(NOTE: Occasionally pullets will begin to lay at four months. These birds, as a rule, never attain sufficient size. They are inclined to lay small eggs, and many go into a fall or spring molt, not having developed sufficient strength during the growing period to enable them to stand up throughout a year's production.)

MILLER'S IDEAL Mammoth Incubators

Bloomdale, Ohio,
May 24, 1922.

J. W. Miller Co.,
Rockford, Ill.

Gentlemen:

You may be interested to know about the success I have had with my Ideal Mammoth Incubator that I purchased from you last fall.

I am glad to tell you that I am more than pleased with your Ideal Incubator. It certainly has given me wonderful hatches and at the same time it is so easy to operate. I have raised over 90% of all the chicks that I hatched in my incubator and the hatches average over 80% of all eggs set for the season.

I certainly like the baby chick business and want to increase my hatching capacity for the coming season, so please make me your lowest price for an Ideal Mammoth of 18 or 20,000 egg capacity as I would have nothing else.

I also want to state that you never saw nicer, stronger, healthier chicks than what I hatched in your Ideal machine. I have had much better hatches than some of the others around here who are running other makes.

Wishing you success and remaining always your customer, I am,

Respectfully yours,

George Sturgeon.

Here's Why---By J. W. Miller

More than fifty per cent of those who purchased Ideal Mammoths last year have bought more of them this season.

Satisfied Customers—
The Best Advertisement.

Many of the largest and best known hatcheries have increased their capacity by installing Ideal Mammoths this year.

They Know Where to Buy the Best

Our triple deck gives larger capacity than any other Mammoth using the same amount of floor space.

More for your Money When You Buy an Ideal Mammoth.

The Ideal uses less fuel than any other Mammoth

Production Costs Reduced.

The Ideal Mammoth, up to 10,000-egg capacity, is successfully heated with the Ideal Oil heated hot water supply boiler—

A Dependable, Economical Heating Method.

The Ideal hot water heater successfully burns hard coal, soft coal, coke, wood and kerosene—

You Don't have to Worry About Fuel.

The Ideal Turning Device really turns the eggs and never breaks them.

Increased Production and More Profits.

The Ideal Mammoth requires less labor to operate than any other—

Time Saved Is Money Made.

Send today for my new catalog. It tells the whole story and explains my special proposition.

J. W. MILLER CO., Box 2, Rockford, Ill.

ARTIFICIAL LIGHT

Makes a greater net profit at a lower cost than anything else you can buy. Are your molting hens back to laying and have your pullets started to lay? Artificial Lights will surely make them start.

Portable 00 Candle-Power Light

Makes brighter, whiter, more brilliant light than electricity. Burns kerosene or gasoline. Costs less than one-half cent per hour. No odor. No smoke. No wick to trim. No chimney to clean. Storm, rain, sleet and snow proof. Easy to carry, hang up, or place anywhere.

Made of heavy metal, nickel plated. Shines like mirror. Has special reflector top; throws light down equally all over room. Automatic tip cleaner prevents clogging of carbon or dust from fowl's scratching. Can adjust light high or low. One light sufficient for 100 fowls, or house 18 by 18 feet.

This is the only light of its kind on the market that will give you absolute satisfaction. No other lantern gives such a uniform distribution of light; and that is what counts in the hen house.

Give your fowls 14 hours' daylight. Keep this light burning in your poultry house morning and night. Nothing will pay you better.

On account of the increasing demand for our Lanterns we need an agent in your neighborhood to introduce them.

Write for Free Circular and Price. It will pay you to answer this ad today.

PIEPGRAS LIGHT CO., 512 Powers Bldg., TINLEY PARK, ILL.

MANTLES

Do you have trouble with your mantles cracking or falling off easily? Send us 10 cents in stamps and we will mail you a sample of our Real Rag Mantle which is made of Wood Fibre and Guaranteed to be stronger than any other mantle made. These mantles will fit all makes of Gasoline Lamps and Lanterns. Be sure and state whether you have a 1 or 2 mantle fixture.

PIEPGRAS LIGHT CO., 612 Powers Bldg., TINLEY PARK, ILL.

Classified Advertisements

Under this heading ads will be inserted for eighteen cents per word each month for less than three months, or forty-five cents per word for three months. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under classified headings. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from American Poultry Journal than from any other poultry journal—none excepted. On writing any of these advertisers, mention American Poultry Journal. All copy for Classified Ads must reach us by the 17th of month preceding date of issue. These rates void after May 20th, 1923.

Sioux City, Iowa

Oak Dale Farm's S. C. White Leghorns

Successor to D. W. Young and Owen Farms S. C. White Leghorns

Special price **October Sale**

Cockerel Bargains Sale Closes Oct. 31

For \$5.00 Oak Dale Farm will

ship you a June hatched cockerel bred from our Hoganized high egg-producing females. This cockerel will be a husky, well-developed, quick-growing youngster sired by an extra good male out of a female personally selected for egg production by Mr. Lamon.

This cockerel will be worth 100 cents on the dollar. Put fifty cents worth of feed through him and he will double in value. Grow him out in your own yards. If your laying flock needs

"high average production blood" use him in the breeding pen next spring. One of these "special-price sale" cockerels will increase the average egg yield of your flock. Send your order today. Describe the particular kind of a cockerel you want. Order direct from this advertisement. While these cockerels last, \$5.00 apiece. Your order will be filled to your entire satisfaction.

For \$7.50

Oak Dale will ship you a May or June hatched cockerel bred from a pen of standard type, Hoganized, high-egg-producing females. This cockerel will be more fully developed and because of this will show more Standard quality than a \$5.00 cockerel. He was sired by a valuable breeding male. In other words, for \$7.50 you will get a classy cockerel which, judged by any system of valuation, will be worth \$7.50 just as he stands, and a cockerel which promises to double in value within six months. A goodly proportion of these \$7.50 cockerels promise to develop into males of a quality that will win top places in medium sized shows. While they last you can have them at this bargain price. Describe your needs and order direct from this advertisement. Your order will be filled to your entire satisfaction.

These cockerels are pleasing breeders from Canada to Georgia, from New York to Kansas. Read this sample letter and note what this breeder says: "PARTICULARLY PLEASED WITH THE COCKEREL. HE IS A LITTLE BEAUTY."

Infantry School Detachment, Fort Benning, Ga.,
June 10, 1922.

Dear Mr. Lamon: The cockerel and pullets I ordered of you arrived on the 6th, and I am completely satisfied with them. I consider them the best birds of their age I have ever seen. As was natural, they were a little tired and peaked after their long trip in confinement, but picked up almost immediately when put on range. Mr. Jenkins, the man I had you ship the birds to (a livestock and feed dealer of long experience), considers them the best he has ever seen also. I am particularly pleased with the cockerel. He is a little beauty. I am confident they will fulfill all my expectations as breeders. I waited a few days after receiving them before writing you, as I wanted to see whether the change of climate would affect them noticeably, but as far as I can see so far the extreme heat does not bother them at all. All the pullets arrived leg-banded, so I can refer to a particular bird, should I find it necessary to write you concerning any of them; but the cockerel was not leg-banded. If you show him still on your books, numbered, with his pedigree, I wish you would give me his number, and I will hand him. In this way, should I want other mates for him from you in future, you can probably give me a suitable mate. I am completely satisfied with my first transaction with you and hope and expect to do more and greater business with you early next year.

Sincerely,

FRANK D. SMITH.

Pullet Bargains Sale Closes Oct. 31

For \$3.00 Oak Dale Farm will

send you a real Standard-Type high egg-bred, partly grown pullet, sired by a strong sire and bred from a pen of heavy-laying Hoganized females, personally mated by Mr. Lamon. Outside she will show the refinements of the D. W. Young strain; inside she will have the breeding qualifying her to produce from 100 to 250 eggs during the first laying year. That is the combination which made the D. W. Young strain the greatest combined beauty-and-egg strain of

Leghorns the poultry world has ever known. Such a pullet will lay early, lay many, "look fine" and be "admired by all"—for example, note these recent letters from Mr. C. H. Lester and Mr. P. O. Bailey:

Highland Mills, N. Y., August 19, 1922.

Mr. Harry M. Lamon, Mgr., Oak Dale Farms, Le Roy, Minn.

Dear Sir: Got the first pullet egg from your birds on August 8. Have been holding them back as much as possible. They look fine and are much admired by all that see them.

Yours truly,
C. H. LESTER.
Stockton, Ill., Sept. 4, 1922.

Mr. Harry M. Lamon, Mgr., Oak Dale Farms, Le Roy, Minn.

Dear Sir: Your stock sent to me was fine stuff. I wish you would send your catalog to my address.

Yours truly,
P. O. BAILEY.

For \$5.00

Oak Dale Farm will ship you a typey, rapidly maturing pullet bred identically the same as the cockerel listed in the opposite column. Last year many of these \$5.00 pullets grew into exhibition hens worth from \$15 to \$30 apiece. If you are the type of breeder who uses only mature hens for breeding this type pullet will pay for herself on the market egg basis alone the first year. Figure it out for yourself. 150 eggs at 40 cents per dozen equals \$5.00. And then as a breeding proposition during the 2nd, 3rd, 4th and 5th years she should, during the four breeding seasons, produce over 200 chicks. Then, too, she might develop into a \$30 hen. Exhibition type and heavy egg yield are bred into these pullets through generations of careful, purposeful breeding. The exhibition type is fixed! The eggs are in them. Type plus eggs. Both combined in the one individual. For proof read this recent letter from Mr. J. H. Davis:

82 Lansdowne St., Peterboro, Ont., Canada.

August 31, 1922.

Dear Sir: On June 22d I sent you an order for 3 cockerels, 10 weeks old, and 3 pullets, 8 weeks old. One of these pullets has laid 4 eggs already, commencing on Sunday, August 27, just skipping one day so far, which appears to me a bit extraordinary, as this pullet is of exhibition type. Will be ordering some exhibition type chicks or eggs in the spring from you. Thanking you for past favors, I am, respectfully yours,

JNO. H. DAVIS (Per A. D.).

These pullets, while they last, \$5.00 apiece. Order direct from this advertisement. Satisfaction guaranteed; you alone to be the judge. Could anything be fairer?

Exhibition Cockerels--ready to win any show in the U. S. Every one 100% pure D. W. Young blood. Write fully describing your needs. Write today to OAK DALE FARMS, Box A10, Harry M. Lamon, Mgr. Le Roy, Minn.

First Prize Imperial Ringlet Cock at Madison Square Garden, New York—the blood of this great bird is all through my Special Sale List.

60 Prizes Out of 60 Offered at Both Shows
Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

**Supreme at Madison Square Garden
Is Supreme Everywhere**

BARGAIN SALE FOR 1922

My Special Sale List is now ready and offers the most extraordinary bargains in extreme high quality breeding and exhibition birds of First Prize Sweepstakes Champion Madison Square Garden blood. **THIS IS YOUR OPPORTUNITY** to secure Madison Square Garden Winners, and sons, brothers, sisters and daughters of these winners, and birds of the richest First Prize Sweepstakes blood at prices **FAR BELOW THEIR VALUE.**

THIS SPECIAL SALE LIST

is full of the **rarest** bargains ever offered in the history of Barred Rocks and it will be to your interest to write me for a copy at once and secure the Grand birds you need at **SAVING PRICES.** A copy will be mailed immediately upon request.

Imperial Ringlets are the Standard for all the Barred Rocks in all America. They have won first prizes and Silver cups for my customers in thousands of Show rooms in every civilized land.

I believe the most prominent breeders are using IMPERIAL "RINGLETS" to improve their stock.

Bargains in Eggs from the finest exhibition matings in the world. After June 1st, one setting, \$10; two settings, \$17.50; four settings, \$30; 100 eggs, \$45.

Elegant Catalog Mailed Upon Request

This "Add A Section" Idea Makes a **BIG HIT** With Poultry Raisers

If you are planning hatches of from 220 eggs up to 1760, here is the machine that will just exactly meet your requirements—you can start with one section and add additional sections as you wish—you don't have to spend a lot of money to start—you can begin on just as small or large a scale as you wish, letting your incubator grow with your business.

The **MULTI-DEK** SECTIONAL

Sectional Incubator is the only one of its kind on the market—it was designed especially for the poultryman who wants to let his profits pay for his expanding business.

220 to 1760 Egg Capacity

From one to eight sections, each holding 220 eggs can all be heated with one heater. Each or any section can be operated independent of the others. The Multidek is designed and built correctly for perfect incubation—it will hatch every hatchable egg.

Automatic Egg Turning Tray

is a feature that is a very important one—it means a great saving in labor and insures accuracy in the turning of every egg at proper time.

You Can Have **HOT WATER** or **HOT AIR**

Multidek Sectional Incubators are made so that either hot air or hot water heating can be used—you have your choice. While some prefer hot water, others express a preference for hot air heating. Either one is equally effective—it's simply a question of choice.

We furnish the Multidek—any size you want—from one section up to eight. We ship you the lumber all cut, fitted, marked and ready to put together. Any one can set a section up ready to operate in a few minutes.

For the man who is handy with saw and hammer and would like to save money by building his own Multidek, we will furnish complete set of plans with measurements and complete working plans so that you can build it yourself.

Mail Coupon for Prices and **FREE** Illustrated Folder

Fill out and mail coupon and get free folder telling all about this practical economical incubator. Folder tells how Multidek is made—how it is heated—why it hatches better—also low prices. Write today.

WINS SWEEPSTAKES CHAMPION

Over ALL Birds

of Finest Quality in Show with

**HOLTERMAN'S
"ARISTOCRAT"
BARRED PLYMOUTH ROCKS**

Still Another Sweeping Victory!

New Victories Every Day!

From J. E. Kent, Texas:

"Do you remember my telling you to keep your eyes on Kent? I won at the great 'HEART OF AMERICA' Show First Exhibition Hen, Second Pullet-bred Cock-bird, and Fourth Pullet-bred Cockerel in one of the strongest shows ever held in the South, and now at DALLAS I made almost a clean sweep of first prizes in the pullet-bred line, winning First, Second and Fourth Hens, First and Fourth Pullets, First Cock-bird, Second and Third Cockerel, First and Third Pens, and First Display of Light Barred Rocks, and that at the STATE MEET OF THE BARRED ROCK CLUB."

Best for LAYING

H. R. Gulick, California, writes:

"From the 'Aristocrat' eggs purchased from you directly, we have four hens which laid a total of 962 eggs for their pullet year. Their records are as follows: 200 eggs, 221 eggs, 256 eggs, and 285 eggs." (This is an average of more than 240 eggs for each one of these females.)

Best for MARKET

From A. L. Baldwin, South Carolina:

"I find that Holterman 'Aristocrats' lay more eggs than any other Barred Rocks I have ever seen and they also grow faster. But I wish to tell you of the splendid winnings the 'Aristocrats' are making for me this fall, especially the 'Aristocrat' cock-bird. This bird won First Prize at our show, again first at our big State Fair, again First at Spartanburg, again First at the Georgia State Fair—making 4 first prizes for this grand cock. In addition, I won a number of other First Prizes at these shows with my 'Aristocrats.' I am very proud of my birds."

**Nearly 10,000 Other
Letters Like These
In My Files!**

**MY FREE BOOK
TELLS THE REASON**

GET IT! →

T. O. Whitehead, of Colorado Springs, writes September 27, 1922:

"Hooray! My 'ARISTOCRATS' on top! At the Colorado State Fair my Holterman 'Aristocrats' won 1st Cock, 1st Cockerel, 2d Cockerel, 1st Hen, 1st Pullet, 1st Pen. At Arkansas Valley Fair, one of the largest fairs in the West, I won 1st Cock, 1st Hen, 2d Pullet, 1st Cockerel, 2d Cockerel, 1st Pen, Special on best display in Rocks, and Sweepstakes on Champion Cock of the show against all birds in the show. These were shows of finest quality." In thousands of shows everywhere "ARISTOCRATS" prove themselves to be unquestionably the world's greatest prize winning strain of birds.

You Also Can Win With Holterman

**"ARISTOCRAT"
Barred Plymouth Rocks**

For years my "ARISTOCRATS" have maintained their deserved reputation for being surest winners at exhibitions and egg contests. Each year I improve my stock to a point that assures maintenance of "ARISTOCRAT" superiority, and in consequence, my birds are able to win in any competition, anywhere, and at any time. This has spread my fame and the "ARISTOCRAT" name the world over. Every Customer of Mine Shares in My Leadership. This fall I offer, at "quick sale" prices, a limited few of the

Best Birds of My Entire Career

**Prize Winning Show Birds
Guaranteed to Win at Any Show**

The blood strain of every ARISTOCRAT is so well defined and so greatly superior to any other Barred Rocks in existence that I actually GUARANTEE EVERY ARISTOCRAT SHOW BIRD to be a Prize Winner.

Get the Details of This Amazing Guarantee!

If you have a desire to win with Barred Rocks at any show at all, no matter where, simply write me today, giving me the necessary details, and I will not only make you a very special quotation by return mail, but I will also furnish you MY SPECIAL SHOW BIRD GUARANTEE, the one guarantee which gives you absolutely iron-clad protection. But do it today, so that I may take care of you right.

Wyckoff's S. C. White Leghorns

America's Business Hen

Their 42nd Year of Direct Breeding and Improvement

Acknowledged everywhere as the world's greatest laying strain—unequalled in standard qualities.

SPECIAL ATTENTION is directed to the fact that it has been proven, on careful investigation, that the world's greatest record flocks of high quality Leghorns have a foundation wholly, or in part, of this famous strain. Conclusive proof that they are THE GOLD STANDARD OF S. C. WHITE LEGHORN VALUE.

BREEDING COCKERELS

A wonderful lot of strong, vigorous, healthy, range-reared cockerels, all produced from a special selected lot of three year old hens representative of our highest quality. The blood lines you need to double the value of your next season's breeding pens.

Send for free descriptive catalog with numerous photographic illustrations of this most completely equipped plant, and Special Illustrated Cockerel Circular giving description of the different grades, with prices—prices that are most exceptionally low, when quality is considered. Place your orders at headquarters and get the best.

C. H. WYCKOFF & SON

Aurora, Cayuga County, New York

Four Incubators in One

Our "Four In One" is a BABY MAMMOTH. Has FOUR complete incubators IN ONE and heated with one heater. With this one section a hatch can be taken off every week or you can set FOUR different kinds of eggs at one time, as you choose.

"Four In One" 800-Egg Section

You can start with just one "Four In One" 800 egg section and increase the capacity, section by section, to a mammoth machine. It takes only a few minutes to add new sections.

Shipped with legs removed and will easily go through a 2-ft. door sideways.

7 Distinctive Features of the Schwalge Incubator

EACH EGG CHAMBER IS A SEPARATE UNIT, holding 200 eggs. Any chamber not in use may be shut off by means of shut-off damper, thus saving oil.

PURE RADIATION HEAT. The heat travels through 4-inch heating tubes, giving a large heating surface and causing a mild heat.

MOST UNIFORM TEMPERATURE. The very uniform temperature in all egg chambers has won for the Schwalge an unexcelled reputation. The heat to the different chambers is controlled before it reaches the chamber (not afterward), which insures the most uniform temperature throughout.

EFFICIENT VENTILATION SYSTEM, independent of the heating arrangement and easily regulated. Makes the chicks strong and healthy.

MOISTURE GENERATOR for dry climates or high altitudes. Water is dropped on hot tube inside the egg chamber and evaporates.

HIGH GRADE CONSTRUCTION. Sound lumber, 28 gauge galvanized iron and a liberal amount of fire-proof asbestos is used in the construction of the Schwalge Machine. Packed well to hold the heat very steady.

MECHANICAL EGG TURNING DEVICE. Our new 1923 Model is equipped with a mechanical egg turning device. One simple movement of the lever turns every egg. Can easily be removed, if turning by hand is preferred.

SECTIONAL CONSTRUCTION

Enlarged to 9600 Egg Capacity [12 "Four in One" Sections]

You should buy the Schwalge Incubator because it has the strongest guarantee back of it, which eliminates all risk.

My Buff Orpingtons

Perhaps no line of Buffs in existence carries the purity of color now possessed by my Strain. By this I refer to the strength of undercolor in every section, the soundness in tail and wing color, the soft, even, level surface color of Females and the brilliant, sparkling, golden luster in Males. But this matchless excellence of color does not make a complete Orpington. I have always maintained and cautiously guarded massive proportions, large capacity, broadness with length, stout bone, proper station, neat head*points and good length of feather. These balanced color and type qualities in my best Buff Orpingtons are the fruits of my 21 years of constructive and most cautious breeding. This matchless achievement accounts for my unapproached sensational winnings at the Great Chicago Coliseum Show past four years as well as my ability to serve you best in Buff Orpingtons.

My White and Black Orpingtons

While I do not breed White and Black Orpingtons so extensively as Buffs, the very same basic principles of constructive breeding is utilized and I have quietly furnished many of the most sensational Winners in White and Black Orpingtons known to the American Orpington fancy. Prudent purchasers do not object to paying substantial prices when they get this quality and the

finest of my many years of breeding are now open to your purchase. My outstanding specimens this year carry the neatest head points, the greatest capacity, the broadest backs, the lowest tail carriage, the fullest breasts, the heaviest bone and the best station that I ever owned! My old customers everywhere will fully appreciate this news and will order early as usual.

In every single instance the quality will over-balance the price whether the price be \$5 or \$50 per bird and your complete satisfaction is guaranteed.

C. S. BYERS

Successful Orpington
Specialist 21 Years

HAZELRIGG, IND.

1900--"Kerlin-Quality"--The REPEAT ORDER STRAIN for 23 years--1922

Since the year 1900 this world-famous strain has been paying mortgages, educating children, buying farms, beautiful homes and building most substantial bank accounts for *Thousands* of our customers.

For 1922

For the remainder of this year we offer in limited quantities:

**Pullets
Yearling Hens
Male Birds**

This Kerlin-Quality Trademark is your PROTECTION. Without it no shipment is genuine.

For 1923

For the approaching season of 1923 we are already booking orders for:

**Hatching Eggs
Baby Chicks**

All From Our Famous 265 - 270 Egg Strain English-American

Single Comb White Leghorn Foundation Stock

We are offering our matured stock at remarkably low prices and we are making a *Money-Saving* proposition to our customers who place their orders early for Hatching Eggs and Baby Chicks for delivery during the coming season. Orders are coming fast. Have already booked orders for more chicks at this early date than any previous year. May we have the pleasure of mailing you our illustrated book? It's *Free* and brim full of information. It tells about our *Stock, Service Department*, etc. STOP "Keeping Chickens" — let Kerlin-Quality Chickens "Keep" YOU!

Send for Catalog

This catalog is interesting even if you aren't ready to buy. It tells a lot of facts every hatcher should know and it points the way to bigger profits. Write for it today. It is free.

the man who wants profits wants a Wishbone

"I've tried 'em all, but give me a Wishbone every time. When I think of the backaches and worries and expense I had with other machines, I realize what a sucker I was not to have bought Wishbones long ago. There's no comparison between a Wishbone and any other mammoth.

"Take work, for instance. There just isn't any with a Wishbone. No transferring eggs and messing with the machine, all day and every day. You put your eggs in these trays and forget 'em until it's time to take the chicks out. All you do is put fuel in the heater—and rolling the eggs is a cinch with the Wishbone turning device. Notice, I said 'rolling'—the eggs aren't 'shifted' on end. They lie flat on their sides, the way they lie under a hen, and when they're rolled they're rolled all the way over. It sounds almost too easy, but if you'll read the catalog, you'll see the devices that do the work for you!

"The Wishbone is a giant for profits, too. Talk about the hen that laid the golden eggs! The Wishbone turns your eggs into golden, fluffy chicks—the kind everybody is crazy to buy because they're so strong they stand shipping, and they're as livable as Methuselah himself. I pulled \$15,000 net profit out of my 40,000 capacity last season without a minute's worry!"

THE NEW WISHBONE WON'T LET YOU WORK

"Did you read about the 1923 improvements? It's great the way the Wishbone beats its own record every year. The Hatching and Rolling Tray—the new Temperature Regulator without balances and weights—the improved Moisture Pan that takes the curse out of cleaning. I tell you the Wishbone people are helping us hatchers all the time.

"Take my advice. Order a Wishbone even if you buy only two sections as a starter. **START RIGHT**—and then buy more sections and increase your capacity just as fast as you're ready for it.

"And talk about service! Those fellows are certainly on the job. They give service with a capital S! They live up to their promises; any time I want something, they are so prompt, careful and 100% reliable; it's a pleasure to deal with them."

The Wishbone Blue Flame-Oil Burning BROODER is the Chicks' Best Friend

NO valves to stick
NO strainer to clog
NO thermostat
to go wrong

**Economical
100% Reliable**

Unquestionably - the best way to raise Chickens

is to use Wishbone Brooders. Here are the actual facts: You will raise more chicks; you will raise healthier chicks. You will be trouble-free. The Wishbone needs no coaxing--no nursing--it has its job and does it.

4 Sizes—4 Prices

No. 22 (50-100 chicks)	\$10.00
No. 32 (350 chicks)	16.00
No. 42 (500 chicks)	19.00
No. 52 (1000 chicks)	22.00

Prices a little higher in far West.

Send for Booklet

It interestingly tells how the Wishbone Valveless will make this your happiest winter. Write for it today.

DEALERS

You can make real friends as well as real profits by selling Wishbone Brooders. We protect you in your neighborhood. Write for special dealer proposition.

The Wishbone Valveless ~ Blue Flame BROODER

is the ideal brooder long sought by poultrymen and invented, naturally, by a practical poultryman, who, understanding the problem from A to Z, solved it.

It is 100% reliable and amazingly free from trouble. In a jiffy it generates an intense blue flame without priming or pre-heating. You just put a match to the burner!

The oil flows by gravity direct through a big half-inch feed pipe from the large one-gallon reservoir to the burner. It is unhindered by valves, thermostats or strainers. It flows as surely and continuously as the sun rises and sets.

There's no work with a Wishbone Valveless. You fill the large oil tank, light the burner and leave it alone till you need to fill the tank again. And it saves you money in every way. It costs less to buy. It costs less to operate.

The Wishbone Oil-burning Brooder is superior in efficiency to every other type. It is much more convenient and cleaner than the cumbersome coal-burner. This year the coal scarcity is almost universal; more than ever then it is time to say goodbye to the worries and work and disadvantages of the old coal-burning brooder, and say hello to the easy-to-operate, never-failing Wishbone.

A word about ordering. If there is no Wishbone dealer in your neighborhood, we will fill your order direct, giving it prompt, courteous treatment.

The American Incubator Manufacturing Co.
202 Neilson Street, - - - New Brunswick, N. J.

HEATER WITH
CANOPY REMOVED

Turning the adjusting handle lifts and lowers the burner. Lifting the burner lowers the flame. Lowering the burner increases the flame.

OWEN FARMS

S. C. Rhode Island Reds Stand Pre-eminent.

Their outstanding leadership has been established along two lines. First, their wonderful perfection in Standard quality that has enabled them to make crashing victories in my hands or in the hands of customers at nearly every show on this continent and in a score of Foreign Countries. Second, their finely developed prepotent heavy laying qualities that have enabled them to make records well over the 200 egg mark every time they have been trap-nested with 301 the record of the leading Owen Farms pullet that has been reported to date.

STANDARD COLOR HEAVY LAYERS

are here in abundance among my enormous flock that has been line-bred for generations from my winners at Madison Square Garden, Boston, Chicago, Kansas City, Syracuse, and other National Shows.

1922 YOUNGSTERS

are a wonderful lot. 14 of my superb breeding males surround this advertisement. Study them. You can secure sons and daughters from these sires and others equally as good. Tell me your exact wants and will quote you carefully and fully. Prices range for cockerels \$7.50 and \$10.00 each for strong, sturdy utility birds; \$15.00, \$25.00 and \$35.00 for choice breeding and show cockerels; \$50.00, \$75.00 and \$100.00 each for cockerels for the larger shows. For Pullets: \$5.00 and \$7.50 each for splendid utility breeders and good layers; \$10, \$15 and \$25 each for choice breeders and show birds; \$35.00 and \$50.00 each for extra choice birds for the larger shows. A few outstanding stars each year bring higher prices. Have 200 breeding and show hens for you that have real quality. A few choice exhibition cock birds are a matter for correspondence.

MY BUFF ORPINGTONS

are equally good and have the same price range.

GUARANTEES

are given in my 84 page free booklet. They are liberal and absolutely fair. Do not want you to keep any shipment that is not absolutely satisfactory. Rest birds 48 hours and return in good order. I will pay return charges on all birds at \$10.00 or more each. Your money back if you want it. This rule has prevailed for years and only three or four come back each year. Careful records are kept of every bird shipped so you can secure at any time additional birds of just the proper breeding. Over 60% of my customers have sent more than one order. This is the part of my business that gives me the most satisfaction. "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism. Write me fully and freely and receive prompt reply, addressing

Getting the Pullets Down to Business

EGGs are going up, up, up! They are selling October 1st on our local Indiana market at 45 cents per dozen. The rise has been steady and rapid the past few weeks. Hens are now in molt (the poorer hens in some flocks have started some time back) and egg production is consequently being shifted to the shoulders of the 1922 hatch of pullets, and prices are going higher and higher.

We must now put the dependency on the early pullets to keep the egg baskets filled. Those who have pullets sufficiently mature to be laying or are about to commence production are fortunate. The reward will be their's for there is a nice profit in winter eggs. I have pullets that started laying at five months and ten days, beating my last year's record by six days. This is rather early laying for an American breed (Wyandottes). Although I wasn't fortunate enough to start hatching before April, I still expect to receive a fair quota of winter eggs.

Now, let me offer a word of caution, just a bit of advice to those poultry raisers who are disposed to rest on their oars now that the pullets are maturing and in showing indications of getting down to business, appear capable of looking out for themselves. To the owners of such flocks I say, do not become slack and remiss in your work and attention to your birds. Do not let the pullets shift for themselves now and expect to reap a harvest of winter eggs. Do not defeat the very object you desire to attain. The transition period from the non-productive state to that of production, is a most critical time. The proper feed and handling during this turnover period will give you the results you desire, while negligent care at this time will work just the other way around.

Put in Laying Quarters

First, I would suggest that if the pullets are not now in their permanent winter quarters, no time should be lost in transferring them. It is always advisable to make the change some time previous to starting production, so they will be entirely familiar with their surroundings and all settled down and perfectly at home, as it were, when they attain the readiness to shell out the eggs. With such preparations there will be no interruption. When the pullets have started laying, do not persist in changing them about from one pen to another, for this is bound to make them restless and nervous and interrupt laying. A cessation in laying for a time will cut into the profits materially. And then, too, there is the likelihood that the pullets, when once they stop laying, may be inclined to lay down on the job entirely until spring. Remember it is harder to start a bird laying than it is to keep her laying. Therefore, do nothing to interrupt laying once it is commenced.

By Otto E. Hackman

**Feed liberally in November—
Heavy layers must have plenty
of food—Health is the basis of
profitable production.**

Do not stint the rations of the maturing pullets this month, whether they are just about to lay or have started production. Nothing is more disastrous than this. The fast developing or laying pullets need lots of good, wholesome food. We cannot overfeed a growing youngster. This is my fixed opinion. A fast growing and developing bird is always hungry, being especially voracious just before reaching maturity. There seemingly is no limit to its capacity for consuming food. And the appetite must be appeased.

A heavy layer must necessarily be a big eater. There must be a surplus of food consumed over and above the bodily requirement, and this goes to the manufacture of eggs. Without this surplus there could be no eggs. Therefore, we must feed them liberally; give them all they want. They will repay us many-fold by keeping the egg basket well filled when prices are high.

I do advise making an abrupt change in the rations when transferring pullets to their permanent winter home. They should not be put on the regular laying ration at once. The change should be made gradually so as not to upset them. All grain should be scattered in deep litter to encourage exercise. Exercise is of prime importance in securing and maintaining health; and health is the basis of profitable production. Keep the quarters clean and well ventilated. Give the birds ample room to avoid overcrowding, for crowding is very harmful.

The Old Stock

How is the old stock faring? If the flock has been fed throughout the summer with animal protein supplement the molting process may be just beginning in the more continuous layers, but if the flock has been grain fed, the molt may be pretty well finished. The late molter will require comfortable quarters. Cold weather will come on and catch her with only a partial coat of feathers and unless she is comfortably housed she will suffer.

Feed the molting fowls well to bring them through in the quickest possible time. The plumage should be examined frequently during the process of molt to detect any feathers that may come in off-colored or twisted. When any such appear, they should be pulled out so that others may grow in, which usually come in all right. Overcrowded and poorly ventilated quarters have a bad effect on the growth of the plumage. The molting birds should not be forced for eggs, as egg production and feather growth cannot be carried on successfully at the same time. The molting process is a trying ordeal and we must strive to protect the birds as much as we can. Green feed in abundance should be available at all times.

Old Breeds That Are Being Overlooked

IN THE old days of Aladdin's Wonderful Lamp, the huckster who went through the streets crying, "New lamps for old," had no difficulty in collecting all the old lamps in town. People readily traded the old for the new while, according to the story, there was one lamp worth the whole collection and the huckster got it. To those choosing a poultry breed, E. H. Hoffman, in the September American Poultry Journal, suggests fuller consideration of the merits of the older breeds. He is right. Many a fancier has found his Aladdin's lamp, the kind of feathered favorites that has filled his leisure time with interest and pleasure, brought him some convenient dollars and which to him has been worth all the other varieties put together. Nor has he always found it among breeds of recent origin. If he had been chasing the latest novelty he would never have found it at all.

Judge Hoffman notices the altogether disproportionate popularity of a few varieties, a fact which, says he, makes our poultry shows top-heavy. To experienced and thoughtful poultrymen, familiar with the wide range of choice among Standard breeds, and familiar with the sterling merits of the older varieties, the pranks of "popularity" are often a matter of regret and something of a puzzle. The question cannot be avoided, as one drives through the country: Why this unending recurrence of a few breeds? Would we have this tiresome monotony if people knew the Standard varieties and felt free to select what they most admire? A few observations as to what really are the factors controlling selection of a poultry breed with the generality of people may not be without interest.

With that class of poultrymen who keep fowls for profit alone, or profit derived only from eggs and meat, this article is not specially concerned. If these people keep a definite breed and do not disfigure the landscape with flocks of mongrels, poultry-lovers have that much to be thankful for. That only the most widely advertised breeds are profitable is to them a natural supposition. They pay no attention to the uncommon varieties; indeed, hardly know of their existence.

Beauty Comes In for Hard Knocks

There is another poultry-keeper who represents a large class. This man would be keeping birds of a more beautiful and less common type if he followed his own choice or that of his wife and family. His home and garden show

By Rev. T. W. Harwood

Many years of intelligent breeding have been put into some of the old breeds—A plea for fuller recognition of good old breeds.

but other influences decided the choice.

Now there is no subject so much discussed among neighbors as hens. No man was ever known to select a breed of poultry without consulting his neighbors. No sooner had Mr. Bright begun to build his poultry house than advice began to pour in over the garden fence. The beauty breeds came in for hard knocks. Mr. Bright has a reputation for business shrewdness to maintain and cannot afford

a love of the beautiful. Good taste with a touch of originality appear everywhere until you go to see the chickens. These are just like the neighbors' birds. In conversation it is explained that Mrs. Bright and the children wanted a breed of striking beauty seen at the poultry show

for esthetic reasons to keep hens that eat their heads off. So he decides to go his neighbors one better on practical lines and invests fifty dollars in two settings of eggs from Hairtrigger's three-hundred-egg Rapid-fire strain, winners in all the laying contests of the world. This story was from Mrs. Bright by way of apology for the looks of her hens. She further confessed that they were performing no miracles as layers. Later the Brights took other advice, got the breed they wanted at first; visitors admired them; the children loved, petted and fed them and, most surprising of all, they beat the Rapid-firers in the egg-basket.

The adoption of a new variety in many cases by the impression that, just because it is new, it is likely to be an all-around improvement on older

breeds and may be expected to excel them in all utility points. This idea may be honestly held by its originators and it certainly pays the boosters of the new variety to cultivate it, but it is misleading for the reason that utility excellence is not a matter of breed or variety but of stock. In the oldest breeds may be found improved strains carefully selected and bred with an eye to prolificacy and constitutional vigor. Much is heard of high prolificacy from White Leghorns, by no means a new breed. Heavy laying stock can also be found among Light Brahmas, Barred Rocks and Langshans, which now rank among the older races of fowl. As for the Hamburgs, justly ranked as a beauty breed, if there are any poor layers among them we have never heard of it. Laying is an incurable habit with them as it is with many of the Wyandottes which inherit prolificacy from them. Hamburg blood has been deliberately infused into the Orpingtons for that purpose. The old Black Spanish also is an (Continued on page 1030)

Silver Gray Dorkings. One of the old breeds. Probably introduced into England by the Romans in the dawn of the Christian era. Not a commercial fowl, but a family fowl, good for eggs and fine grained flesh.

Establishing the Hens in Winter Quarters

AS the crisp, cool days of November approach with their inevitable reminder that the winter is shortly to begin, with its cold, frosty air, its snows and storms, and its short days and long nights. November always sees important changes in Nature. Leaves have fallen, trees are nearly bare, vegetation becomes dried, and all out-of-doors seems preparing for a period of rest. The activities of the poultry farm also undergo a change with the coming of November days. During the summer many of the most important parts of the poultry raisers work has been accomplished out of doors, on the ranges, with his fowls largely depending on the out of doors as well. But, November comes. His tactics change. His activities, along with his fowls, go indoors, or at least they should in large part. November is the logical beginning of the poultryman's production year. His pullets reach laying maturity along in this month, his older hens get through with the molt and rest, and he naturally makes up his new pens about this same time. Thus, November is a starting time for many of the activities about the poultry ranch.

The poultry raiser has long observed that the market price of eggs usually reaches one of its highest peaks for the year during November. Therefore, he doubles his efforts to secure as large an output of eggs as he can for this time. But, he also knows that if he gets his hens to laying in November they will probably, other things being equal, continue through the remainder of the winter, and prices for winter eggs are always high.

There is every incentive for the poultry raiser to do his level best with his poultry flocks during November.

In Early November

In these days the poultry keeper should handle and manage his pullets and hens in a business-like way, in order to secure economical and profitable production. Well begun is half done. That adage applies to poultry splendidly. After closely studying the management of laying flocks during November over a period of over ten years the writer dares to suggest a few rules that, if followed by the average poultry keeper, will result in increased egg production during winter season.

About the first of November confine the pullets and hens within the houses which are to be their winter quarters. This means close confinement, that is the fowls should not be allowed to run out in yards on nice days, but kept within the laying houses continuously from this date on through until approximately the first of April. The writer is a firm believer in the economy of close confinement to winter quarters. He is aware that many times nice days, commodious yards, and apparent desire on the part of the fowls may tempt the poultry keeper to let the flocks out of doors. Nevertheless, this rule, if it is to really accomplish its purpose must be firmly adhered to. Now, there are several reasons why close confinement is a factor in increasing winter egg production. To enumerate:

If hens are to produce any considerable number of eggs in this off season, they must be forced to consume large quantities of dry mash. That is fundamental. If the fowls are allowed the privilege of the yards during November days, most of which are snappy, attractive days out of doors, they will not spend sufficient time at the dry mash hoppers. That is a proven fact. True, they will eat enough to keep themselves in fine condition. But we want more. We want them to eat enough to force egg production. They must be kept where they will be near to the hoppers and constantly reminded that the consumption of the mash is necessary. Keep the laying flocks close to the hoppers. This is the most important reason for close confinement, especially during November, when habits are formed.

By Willard C. Thompson

**Equipping the winter quarters—
Both the poultryman and the
hens go indoors—They should
work, not sleep—What to do to
get maximum results.**

Health is absolutely essential to economical egg production through cold weather. Health is greatly influenced by environmental conditions. It is possible to control the sanitation of the poultry house absolutely. It is scarcely possible to as efficiently and cheaply control the sanitation of the out of doors. The reason is surely obvious. Therefore the argu-

ment for close confinement is in part one of furnishing an environment which will maintain the fowls in perfect health and consequently in condition for economical production. It is true that many fowls are kept close together when confined all the time to winter quarters, and this ordinarily increases the chances for the development of disease, but it is equally true that such danger due to possible disease can be more quickly and efficiently controlled and destroyed within the houses than without.

Labor for the winter care of the fowls is reduced. Where large numbers are being kept, this item is worth much consideration. It speaks for itself.

Exercise, vigorous and lots of it, is quite a necessary factor in forcing for winter eggs. It is more easily and systematically induced when the fowls are enclosed within their pens, than when they are allowed the freedom of the yards. Later in this article the proof of this is offered.

The Sanitary Poultry House

Do not expect a perfectly well-grown, well-selected flock of pullets or hens to lay economically, and continue in good, strong, vigorous health unless they have been furnished a clean and sanitary house. November should see every producing flock of hens shut up within a house of this kind. Sanitation of the poultry house is not expensive, it is not difficult. Just at this time of the year a thorough, and emphasize that word, sanitary cleaning of the poultry house should be made. Again a rule, to be followed more or less closely in preparing the house for the layers:

Choose a clear, drying day for this job. It is not a rainy day piece of work.

Start early in the morning, in order that the house may dry out by nightfall, and be ready for the fowls.

Close the fowls out of the house during house-cleaning. They'll be in your way, and you'll be in their way, and both parties will suffer, and the work will be impeded.

Sweep down the walls, including ceiling, rafters, etc., also the inside of the cloth curtains with an old broom.

Empty out the nest litters and all refuse matter from any place within the house onto the floor.

Take all the movable fixtures out of the house, clean thoroughly, spray with a five per cent solution of standard commercial disinfectant, and leave them in the sun for the next few hours.

Remove all the floor litter, droppings, and other refuse matter. If you have a dirt floor remove two or three inches of the surface along with the litter.

Cover the inside of the windows with old bags.

Spray the entire interior of the house with a disinfectant whitewash. The writer has used, with excellent success, the following formula:

Five parts of cream of lime (lime slaked with boiling water to consistency of thick cream),

One part of kerosene,

One-half part of good commercial disinfectant.

Thin with hot water, as needed. Strain through a screen. Add salt, glue or lard to aid in making it adhere nicely.

Apply with a force pump, being sure to get it into all cracks, corners and crevices.

Allow the house to air out and dry for three or four hours and then return the fixtures, re-litter nests and floor, and return the fowls as (Continued on page 1035)

Wonderful Achievements of Poultry Breeders

MY recollections concerning poultry date backward some sixty years, about forty of which cover my fancying period. But let me say at the outset that I have thus far escaped the point where man's mind reverts chiefly to past events, for I am still actively in the game of hens, gardening as much area as one hoe can cover. With bees and a cow to further cinch the independent course of the outdoor career, I have a feeling that one would have to search a long while to find a more ideal existence.

My topic is mainly reminiscent of past conditions and events! and I have a keen memory of poultry matters dating back to a period when poultry as a special business was unthought of, and as a hobby even was derided. From these memories I purpose to refer to such things as have a bearing upon present-day problems. For with all our modern immense development in poultry lines we are in a state of transition. Our practical methods are yet to be modified to consist with the further growth in the business. But we especially need more light upon the problem of co-ordination of the practical with the fancy; for these joint interests are to be merged into one: a conclusion easily reached if one considers the present trend in poultry matters.

The Early Fancy

To illustrate this point we will go back to a period when the poultry fancy was concerned more completely with fanciful notions as to physical types and conformations than at present. Exhibitions made no bluff at practical considerations. That was the day when the term "fancy" comprehensively expressed the poultry idea. We long since outgrew the word. "Fancier" sounds better. And these names, in the lack of a better, seem likely to stick. Poultry breeder is a doubled-barreled term, self-explaining, and though more cumbersome is to be preferred, as calculated to placate the practical-minded poulterer: who is to be won over to the idea that the breeding to beautiful types is neither a thing above nor below him.

To illustrate the advance in poultry in half a century, few of the approved breeds of today had then an existence. We had the Polish, bred in a crude condition, known as "top-knots." We had a breed called Bolton Grays, named from an English town, and after disappearance for many years were again imported as Silver Campines. An ancient maker and vender of soft-soap (the material article), a regular occupation, by the way, in every village, came to my home and bought all the "Spanish" we had, the first I knew what to call stock identical with our modern Minorcas. He said he could distinguish them by their "white gills." This man's name was Padelford, but the neighbors knew him as Padelfoot. The type of fowl I much preferred at that time would be today styled Dominiques; "domineekers," we called them. In comb and plumage they much resembled the breed of today, but more gamy in habits, and having the run of the farm, ranged

By Fred W. Proctor

Some breeds have failed to stand the test of time—Others have advanced under skillful handling—The first Standard for Rhode Island Reds.

freely. Nested in the hay-mows. Stole nests so freely as to render the setting of hens unnecessary.

Improvements That Are Imaginary

I commenced the last paragraph with reference to the advance in poultry affairs. But considering the prime intrinsic worth of these old-time Dominiques, let me say that the

practical improvement in poultry is largely a thing of the imagination. With three generations to prepare this stock in the matter of feeding and selection in mating, I believe it would hold its own in our laying contests of today with the best. Our actual advancement has been in the line of systematic management and the development of the show status of poultry. It is along these same lines that future progress is to be made.

This same breed of Dominiques have left a permanent record as having been an element in the makeup of our most notable breed—the Barred Rock. Though now bred few in number, they represent the most striking example of a breed built along nature's lines, and apart from the advantage which popularity bestows there exists today no

more useful type. But here is the point where they fall down: their color scheme signally fails to appeal to the fancier. And this mention serves to point a most important truth about the poultry business. Although this is a day of great progress along practical lines, it is still popular approval based upon considerations of beauty as expressed in plumage markings that makes or mars a breed's success.

In this connection I must not forget to mention one of the first poultry exhibi-

tions I attended. At this show in Worcester, Mass., in the hall where first the Barred Rocks and later the Wyandottes (under their present name) made their earliest public appearance, A. C. Hawkins and the late L. J. Upham were strong contestants in Barred Rocks. The Plymouth Rock of that early day showed no marked improvement upon the Dominique as regards plumage. This was before double mating was in evidence and fifteen years of breeding had not given the male a plumage to resemble the females: being many shades lighter, his barring very faulty especially in wings and tail. The hens displayed more uniformity of barring, but were loosely feathered and their plumage grew rusty in summer. And so D. A. Upham (the elder), who was the introducer of the Plymouth Rock, showed no inconsistency in preferring his Dominiques.

The Plymouth Rock was destined to go ahead, and the Dominique to retrograde, in the popular sense, not from intrinsic merit, but on account of the way they appealed to the practical breeders in the first instance. There was magic in the name. And the time was ripe for the appearance of breeds distinctively American, combining the traits of the Asiatic and European stocks. The progress of the breed has been remarkable considering the necessity of shaping their ideals of bodily (Continued on page 1031)

American Dominiques, a breed that retains its original rustic quality of early years, while the genius of breeding has been devoted to its offspring, the Barred Plymouth Rock

Practical Poultry Hints for the Month

WE were talking the other day with a party who proposes to put a heating plant into his poultry house, and he asked our advice about it. We do not believe that artificial heat has any place in a breeding or laying house for poultry. Put it in the brooder house. Think it over. The fowls put on their heavy winter coats in the Fall molt. They cannot take off their flannels and overcoats at will. They keep their coats on twenty-four hours a day. How would you like to sit around, or hustle about and work all day, in heated house if clad in a full equipment of outdoor clothing and then sleep in clothes and overcoat all night in the same warm house? If you did, how long would it be before you would be unable to work and would have to call in the doctor?

Be certain this winter to carefully save all the droppings from the poultry. They are very valuable as a fertilizer for the garden as well as other growing crops. They can be saved more easily if you use dropping boards. Store in a dry place, cover with land plaster or road dust and work over occasionally. After they are thoroughly dried they can be put into barrels and left until wanted for use.

We all have our pet theory about feeding for winter eggs. Our plan is to keep a dry mash before the hens all the time and scatter hard grain in a deep litter morning and evening (sparingly in the morning). Hopper feeding a dry mash in a measure does away with guess work. The hens get enough to eat without gorging themselves and a small feeding of grain in the litter in the morning induces the needed exercise. It may be that a dry mash is not any better than a moist one, other than it is partaken more slowly and the birds are not so much inclined to over-eat.

It is no time to stay away from your local poultry show. We know you are all busy, more than ever, but we have never failed to get full value from a day or more spent at a live winter poultry show. The shows that put on poultry lectures are to be especially recommended. If you have an influence with the management or are on the board yourself see that more is made of institute work the coming four months. Put on talks on "getting winter eggs," "selecting the laying hen," etc., and see what the results are regarding attendance. Somewhere not far away, will be held a good show and you should plan to be there.

A little planning now, will make more money easy the other planning that will surely come with a rush of winter work on the farm. It now looks like a prosperous year for poultry raisers. Feed prices are reasonable while the selling price of eggs and poultry seem firm. Everything is to be gained, not lost, by putting our brains to work as never before.

While winter is not supposed to begin until December, as a real fact, November may be windy and cold. We

By Archie E. Vandervort

A practical farmer-poultryman puts a note book in his pocket and jots down a variety of interesting and helpful hints.

consider it now time to get all the chicks into winter quarters, time to feed for winter eggs, time to finish the doing of the little things that are needed for the winter comfort of our stock. Many poultry farms have had their beginning at different months of the year. Some of them have been

begun in the springtime while a few have been started in late autumn with the buying of a few good breeding stock.

November is a very good month to begin that planning that will be followed by actual operations in mid-winter. It's a good time to plan for your incubators and brooders, have your houses ready, get your breeding stock to lay your hatching eggs and in every way be ready to start at the best season to hatch chicks.

If you still have a few marked birds around your runs, November is the month to dispose of them. It is very unprofitable to winter such.

Order that breeding cockerel this month. Don't wait until the best have been sold and the weather is so cold that birds cannot be shipped safely.

The best time to resand floors is August and September, but if you have not done this, it is not too late now if you can procure the sand.

Clean up the litter on the floors often. Anything but digging around in a lot of wet, foul and filthy litter. Give your hens something better. You wouldn't like it yourself, they don't either.

If possible collect a barrel or two of fine road dust. A bushel of this in a large box or frame, in a sunny location in the henhouse, will be greatly enjoyed by the fowls and will keep down the number of body lice.

A supply of green food for winter should be looked after now, as vegetable and root crops can be bought cheaper now than later if you have to buy them. If you raise them see to it that they are gathered before the freezes injure them, and properly store them.

Cabbages and mangels make the ideal green food for hens in winter. Small potatoes and speckled or cull apples are also relished, particularly when the fowls are confined to their winter quarters.

Look out for the late hatches, especially this month. Don't let them get a setback as winter approaches. Some say late hatches don't pay. Give them a chance and see if they don't.

Winter poultry troubles are the result of drafts over the roosts. Keep wind out of the old chicken house by tacking tar paper on the inside.

The local demand for dressed poultry may be worth looking into. It may be better to dress and sell to the user rather than to get rid of your spare cockerels to some dealer who comes to your door. The private customer likes the well fattened carcass, (Continued on page 1034)

Distinctive Qualities of the Cornish Fowl

By Frank L. Platt

**A very heavy breed—Big boned
and well fleshed—Short feathered
—Fair layers—How to select for
mating.**

THE Cornish breed was first known as the Indian Game. It had one of the greatest booms ever enjoyed by any breed. About the year 1890 specimens were being imported by wholesale from the home of the breed in Cornwall, England. The fanciers of that mining country had developed a unique type to which they had applied the name, Indian Game. The breed was not a true game fowl of India.

About 1846 some red Aseel fowls were imported from India and introduced into Cornwall, where they were crossed with Derby black Red Games, and about 1870 Malay Game blood was fused into this cross. The Cornish Indian Game arose from this cross breeding. The first fowls of this breed to come to U. S. were imported by Dr. H. P. Clark of Indianapolis and exhibited by him at the Indiana State Fair of 1887. He imported them as a sort of large, nondescript fighting fowl for use in the pit in natural spurs. That was before the fascinating and valuable features of the Cornish were known, and since the fuller appreciation of this fowl the pit pugnaciousness has been completely subordinated and entirely subdued.

The Cornish breed is characterized by heavy bone, short plumage and compact build. It may appear like a good fighting fowl, and the name of Indian Game indicated fighting proclivities, but no modern breeder would say that the breed was a game fowl in its nature. Indeed, the name Indian Game is a misnomer, for the fowls are not from

India. They are the one yellow skinned, yellow legged breed that England has produced; and partly because of yellow skin, and partly because of other qualities that found favor with American fanciers, the breed had a great run of popularity in this country.

After the boom subsided in the early nineties, popular interest in Indian Games was languid until 1898, when the breed began to enjoy a more solid growth. Substantial prices were paid for good birds, but there was less spectacular exploitation of the breed. On the surface the breed and its breeders may have appeared to have been

wanting energy, but by 1912 it was plain that a material and healthy growth had been made. The American Cornish Club held its meeting at the Baltimore show that year. The club boasted a membership of 224. The entry at Baltimore consisted of 197 head of Indian Game.

John Ward of New Jersey was in attendance at the Baltimore show of 1912, and met the old breeders, such as Brent, Templeton, Hayes, Cornman and others, and a couple of years later young Ward was elected secretary of the club. He at once began a publicity and educational campaign in behalf of the breed which was new in the annals of specialist clubs. What the Red Club, the Ancona Club, and other live breed clubs have since done in championing and promoting their favorites, is something of a repetition of what was done by that enthusiastic, ambitious fancier by the name of John Ward, who was in love with the Cornish.

(Continued on page 1050)

A pair of Dark Cornish and a good White Cornish cock. These birds are not fighters, but are a wonderful meat type of table poultry.

Twenty-Six Years with Barred Plymouth Rocks

By John W. Yant

**New breeders should acquaint themselves with past progress—
The future—A living and independence from Barred Rocks—
Author is president of American Barred Plymouth Rock Club.**

IT WAS in the year 1896, about the time Gen. Coxey assembled his hobo army and began his march to Washington to ask the U. S. Government to issue non-interest bearing bonds to put the thousands of idle men of that time to work, that I borrowed \$50 at 6% interest to purchase four Barred Plymouth Rock chickens. Being a coal miner at the time and getting but 56 cents per ton for mining, I was compelled to mine about 90 tons of coal to pay for those four Barred Plymouth Rock chickens. A pretty good price I presume you think. It was equivalent to several hundred dollars measured in the miner's wages of today.

Was I foolish? I have never seen the day since the venture that I wished I had done otherwise. Breeding and selling Barred Rocks became my livelihood. What I have today I owe to the chicken business in no small measure. I have never carried on the business as extensively as some, but for years I have been breeding and selling Barred Rock chickens. And aside from profits, I can say that after more than a quarter century breeding Barred Plymouth Rock fowls I look upon the work as one of the beautiful and useful occupations of man. From year to year the work of breeding has continually become more fascinating and new beauties and added worth unfold as the years go by.

As I take a look backward and compare the great beauty and worth of the variety today with that earlier period I can but conclude that I first found the variety in a very crude form, yet possessing the very valuable characteristic of great vigor.

Birds of Twenty-five Years Ago

The males varied greatly in type.

Some were long and lanky, others short and squatty. Birds flat in breast and knock-kneed were plentiful. High pinched tails were numerous. Sometimes the opposite appeared, like a fan-tail pigeon or the large, well spread tail of the Brahmas.

Females were coarse in type and inclined, as a rule, to lay on fat and bag down in the rear. So-called "broken down" hens were common on any farm where the birds were allowed to get fat. In temperament and disposition the variety was not so active, alert and business like as in our best bred strains today. Females twenty-five years ago were also inclined too much to broodiness which has automatically departed to such an extent in many specimens of the most carefully bred lines that they could be truthfully called non-sitters as much so as many of the Mediterranean breeds. This improved utility and egg production feature is the result of the refined form, symmetrical lines, active and alert carriage, all of which is demanded in the modern specimen.

While the variety was made up of many shapes and types a quarter century back, this was a valuable asset to the wide-awake, industrious, persistent, common-sense breeder, for the variety was not settled in a rut, and there were unlimited stores of the choicest material from which to construct the most beautiful and useful fowl the world has yet known. Wise he was in not demanding standards to fit all that great store of breeding material. In fact, do not recollect of anyone demanding a standard at that time for the long and lanky or the short and squatty because nature seemed to favor giving us these various types at the time.

Later the A. P. A. did demand a fixed Plymouth Rock type that produced well; a fixed shape easily recognized as belonging to the breed. That ideal was constructed from

the earlier extremes of the variety, giving us the "medium whole," which is the beautiful Plymouth Rock form of today.

The low-down specimens of the early date gave us the broad shoulders and full breast. The high station oftentimes carried the spread tail of the Brahma. The desirable parts of the two extremes gave us the rather long back, broad its entire length, with breast broad, full and well rounded.

Better station now commanded attention. Those knock-knees had to go. Tail carriage was improved. Lastly, a

refined, symmetrical whole developed from the perfection of the parts. The work is not finished; it still needs close watching and a truly good and typical bird is still the product of a careful, patient breeder. Such birds do not grow on gooseberry bushes. The breeder toils to get one section well molded, then another, until today our Barred Plymouth Rocks in the yards of our best breeders carry a beautiful, refined symmetrical form that start the "Joy Bells" ringing in the breast of the breeder. There is something of satisfaction in the production of such birds; something of triumph in which he inwardly rejoices.

Improvement in Color

Barred Plymouth Rocks were a quarter century old when I took them up. Now early in the second quarter century of their history, they varied in color fairly as much as they did in shape. Many of the males were a light, almost barless gray; others dark and dingy. All were uneven on surface as we understand even color today. They were light in neck and (Continued on page 1028)

Barred Plymouth Rocks as bred at the time J. W. Yant first took up the breeding of this variety. The male won 1st at New York, 1895, and the pullet won 1st at Chicago, 1897. Both birds show the pinched tails, wide bars, and long legs commonly seen in those days.

Editorial

You Have Heard It Said

You have heard it said that the American Dominique, pronounced dom-i-nek, is the oldest American breed. We are reminded of this old breed this month by the reminiscent article in this issue by Fred W. Proctor. We had to dig deep down into the barrel to find the pictures of a pair of Dominiques to illustrate Mr. Proctor's article, and having dug them up and presented them to you, it occurs to us to make a few remarks on breeds and breeding which would seem appropriate at this time.

You have heard it said that under-color is of no value, that perfection in surface color should make a perfect bird. Well, the Dominique has just a plain slate under-color which has no value.

You have heard it said that if it were not for "under-color-itis," a malady affecting both old and young fanciers, we would make more progress as breeders. Well, the Dominique has no under barring to cause a malignant form of hurtful enthusiasm.

You have heard it said that we should have natural standards which do not require the artificial methods of double mating. Well, the Dominique has a natural standard, for the male is required by the Standard to be one or two shades lighter in color than the female, and double mating is not necessary.

You have heard it said that utility should be the first consideration and standard weights should be made to conform to production values. Well, the Dominique has the weights of the egg type hen, which are: Hen, 5 lbs.; pullet, 4 lbs. The Minorca hen and pullet are each 2½ lbs. heavier, and Ancona females are only ½ lb. lighter.

You have heard it said that the broody tendency and fleshing disposition of the larger breeds should be bred out and a more active temperament developed in order to meet the demands for higher egg production. The Dominique has the bright eye, the quick step, the limited broody proclivities, the small body, the long tail, that go with the Leghornized egg type.

You have heard it said that fanciers deal only with feathers, thus wasting much of their time and energy. Well, the Standard of Perfection for Dominiques does not call for parallel, even barring, rather the ideal Dominique should have irregular dark and light bars, and the white bar should be grayish and not clean cut. This color is easily produced and is to be found on thousands of dung-hill fowls all over the country. No time need be devoted to breeding feathers on Dominiques.

You have heard it said that the rose comb is an improvement on the single comb since it is frost proof. Well, the Dominique has a rose comb.

Such are the qualifications of the American Dominique and they are so complete that they meet every criticism that has thus far been advanced against the improved, modern breeds. And yet, not over \$500 worth of Dominiques change hands in a year, while a million dollars worth of Plymouth Rocks, Orpingtons, Wyandottes and Reds are sold.

We were relating these things to our old friend, Leo Brosemer, one day here of late. "Leo," we asked, "what is the reason?" He replied:

"Why, there is no architect back of the breed. The architecture of a people is an index of their mental and moral qualities and the

state of civilization which they have reached. Take the city of Chicago. What if you would take the architects out of it? Did you ever think of that? We must have designers—call them idealists and dreamers if you want to. Without them there would be no church spires, no marble walled corridors in our theaters; indeed, there would be no edifice in the city fitted by beauty and symmetry to fill the eye and gratify the mind. We would have great rows of drab, block houses. Now, the method of construction adopted in nature by the poultry breeder compares with the handiwork of the builder who works with brick and mortar. The breeder must have an ideal, an artistic design. That is the trouble with the Dominique; it has no architect."

Strange, isn't it, how the oldest of all the American breeds, and one which has never been improved by constructive breeders, should today meet all the requirements of the reformers.

The next time you hear the work of the fancier-breeder disparaged, remember the case of the Dominique, unpopular, almost forgotten; and then recall the simple and wonderful explanation of Brosemer, thinker and fancier: "There was no architect." That is equivalent to saying that the aims and ideals of the fancier are indispensable.

A Progressive Show Management

Theo. Hewes is unique as a show manager. He took the Chicago show at a time when it was a wreck and made of it one of the most successful poultry exhibitions in America.

The Coliseum show, under Mr. Hewes' management, has been a forerunner in introducing new features. There are, for instance, no exhibition pens of Barred Rocks or Brown Leghorns at the Coliseum, and prizes are awarded on cockerel-breeding pens and pullet-breeding pens. The name and address of each exhibitor is written on the coop tag of each exhibition cage, that not only the public but the judge may know who is showing every bird.

This year the Coliseum show will adopt another new feature. The judges will issue a record card on every bird in the show that does not win a prize, and that card will be promptly furnished to the exhibitor so he may know the good as well as the bad features of his specimen. This will not be a score card, but will be an index card on which is pointed out and indicated the relative merits of the bird as it stood in competition. It will be a record of the judge's opinion.

This is a progressive step. The comparison show is today deficient in the service it renders to the young exhibitor. It is not making new breeders the way the old score card show did. Mr. Hewes has counted the cost and the labor of giving his exhibitors a record of the judge's opinion, and has come to the practical conclusion that "the exhibitor is entitled to the information."

One more thing: Birds in comparison shows are not weighed. There is a growing feeling all over the country that many of the winners in the big comparison shows would prove to be, in actual fact, below Standard weight. This is particularly true in the case of White Leghorns. At the Coliseum show the White Leghorns as shown by Hillview Farm are among the largest in the country. However, to meet, as far as the Mid-West is concerned, the growing doubt in regard to the actual size of winners in the big comparison shows, Mr. Hewes will state in the premium list of the Coliseum show that "we will protect the Standard against inferior sized specimens, and compel our judges to weigh birds when in doubt." Scales will be on hand for this purpose.

Economics of the Situation

Down in Vermilion County, Illinois, the County Agent tells a true story of a farm woman who made more money on her chickens and eggs than her husband did on his crops.

It will be seen by the chart on page 1006 that live poultry is 55% higher than the average price that prevailed during the pre-war period of 1910-14. Eggs are 18% higher. These are increases in the prices that producers receive.

The raw material that the poultryman buys is lower than before the war, or about at the pre-war basis. Wheat prices are just above the pre-war level, while corn is 14% below and oats are 18% below what they brought the producer before the war.

Prices paid producers for cotton are 82% above the pre-war average, but cotton is only about half a crop. While the price is high, the southern planter has less cotton to sell. That sickly looking fly, the Boll-weevil, takes his heavy toll of cotton. The next high line on the chart is chickens.

Two things interest the poultryman. Will the buying power of the consumer continue high and will grain prices continue relatively low?

Grain prices will depend on the supply of grain and the demand for it. The supply promises to be up to expectations. The production this year as compared with last year's production is about the same in total number of bushels of all grains grown.

The demand for this grain is not as great as it would be under more normal conditions. There is no more grain in the world than the world needs, but Europe has not the money to buy, so Europe goes to bed partly hungry. Our new tariff on industry will only make it more difficult for Europe to buy food, since she will be at a greater disadvantage than before in paying for grain with the products of her own labor.

Our corn crop is perhaps 20,000,000 bushels less than a year ago, but still more than enough for domestic needs. The war stimulated corn production. Europe does not buy corn. It is primarily an animal food, and Europe is not now buying food for cattle, horses and hogs.

The oat crop is probably 15% above last year. Farmers no longer grow oats for profit. Oats fit into their system of crop rotation and no other crop has come along to take its place. Of course, the farmer needs some oats for feed. But there is no longer a big consumptive demand for the surplus of this grain, for there are no longer great commands of cavalry to need horse feed, and in the cities, autos and trucks have displaced horses to a great extent.

The wheat crop is probably 15,000,000 bushels in excess of last year. The wheat market fluctuates widely. If world conditions were not maladjusted, Europe would take this wheat, but Europe is buying from hand to mouth, while Americans must finance the great reserves of wheat that are piling up in the elevators. The capacity to buy wheat for export is lacking.

Summed up, the grain market appears to be well supplied, with a rather stationary demand.

Of the things that look best on the chart, are chickens, wool, butter, eggs, apples, all produced for U. S. markets, as in none of these things is there a heavy exportable surplus which must be sold in world markets. The American with a buying power 50% above the pre-war level is the agriculturalist's best customer. We may talk of hard times in U. S., but compared to the impoverished purchaser of Europe, the American consumer is a rich and lavish customer. Therefore, those things are most profitable that are produced for U. S. markets, without the necessity of out-side world conditions setting or influencing prices.

What of the U. S. customers' continued prosperity, his continued ability to buy? The Guaranty Trust Company of New York, in its recent survey of conditions, says:

"The signs point to a moderate increase in business activity during the coming months. Unemployment in the country has become practical normal. Reports from various parts of the country, in fact, refer to labor shortages in certain districts and trades."

The U. S. Department of Labor, on Oct. 9th, reported:

"From all indications, the elimination of transportation and fuel difficulties will speed production and employment to a higher degree than has obtained since the war."

President Harding in a letter published in the press of Oct. 15th, said:

"The general financial situation has steadily improved and today the country has a brighter prospect ahead of its business, industry and agriculture than at any time since the mistaken program of drastic deflation adopted by those who were then in control of government policies."

Recently the steel corporation raised wages of its labor 20%. It appears that we are tending to higher wages, at least full employment, this winter. The deflation of labor, like the deflation of credit, seems to be arrested. Optimism is justified for the winter season now at hand. The poultryman should be prayerfully happy and thankful this Thanksgiving.

Paying Less for Leghorn Hens

Leghorn breeders feel that of late a great deal of detrimental propaganda has been directed against their favorites, and they are particularly sensitive about the difference in price quoted for heavy and light table poultry.

The breeders of heavy breeds feel that there is too much propaganda favorable to the Leghorn finding expression in spoken word and printed page. These breeders of heavy and dual purpose types point to the fact that the highly specialized State agricultural experiment stations are exponents of the Leghorns and have furnished an immense amount of data on the economic advantages of the specialized egg-type fowl, to the disparagement of the heavier breeds.

It is a fact that we hear very little on the advantage of weight in poultry. One would almost conclude that there was no advantage in size, particularly when he hears a Leghorn man say: "I wouldn't grow the cockerels if I could tell the sex of my chicks as they come from the incubator; and I could afford to throw away the carcasses of my hens after their laying season, for eggs, eggs, eggs are the only thing I want, the only thing in which there is any profit."

The poor old hen that sets in her maternal way and rears a brood of chickens, and then puts on some flesh and fat, seems to be a type accursed by the specialized egg farmer. However, since there are so many of the matronly type, it might be well to see what good there is in them. This will require a comparison, and since comparisons have long been known to be distasteful, we shall endeavor to simply produce facts and figures.

We are indebted to John S. Martin for the following data on the subject:

On June 23, 1922, Mr. Martin shipped 70 White Leghorn hens to M. P. Mallon, receiver and exporter of all kinds of poultry, Toronto, Canada. Those 70 hens weighed 213 lbs., or a little less than 3 lbs. per head. They brought 10 cents a pound, or \$21.30 for the lot. The express on the shipment was \$6.20 and the money order for the remittance was 12 cents, so Mr. Martin received exactly \$14.98 for the 70 hens.

On July 5, 1922, John S. Martin shipped to the same M. P. Mallon, commission dealer of Toronto, 69 White Wyandotte hens. These 69 hens weighed 450 lbs., or 6½ lbs. each. They brought 21 cents per pound, or \$94.50 for the lot. The express on the shipment and the return of the empty crates amounted to \$7.49, leaving a total of \$87.01, which was paid to Mr. Martin by check.

Seventy hens net the shipper \$14.98. Sixty-nine hens net the shipper \$87.01. That is equivalent to saying that a 6½ lb. Wyandotte hen is worth six 3 lb. Leghorn hens when the carcasses reach the butcher block.

It might appear that this is an unusual case because of an 11 cent differential between light and heavy hens.

A subscriber in Los Angeles sends us the market quotations in that market for September 28, 1922. Hens of 3¼ lbs. are quoted at 19 cents; hens, colored, of 4 lbs. and up, 30 cents a pound. There again is a difference of 11 cents per pound.

In Chicago, October 4, 1922, live fowls of 4 lbs. and over were quoted at 23 cents; small hens and Leghorns, 14

BREEDERS OF WHITE WYANDOTTES

John S. Martin, Port Dover, Ont.

WEST BARNSTABLE, MASS., May 20, 1922

Dear Sir:

Words cannot express my admiration and appreciation of what you have done for the White Wyandottes as a breed, in bringing the Regal Dorcas strain to its present high state of perfection. For hardiness, early maturity, heavy layers of good sized eggs, combined with standard requirements, they stand today without a rival.

For over thirty years I have bred and exhibited White Wyandottes and have bought either eggs or stock of many of the White Wyandotte breeders throughout the country, and never had any birds to equal the Regal Strain. I have had some of the heavy weights, also some of the creepers, which average from eighty to ninety eggs per year, per hen, and small eggs at that. I have Dorcas pullets hatched last June laying eggs averaging 25 ounces per dozen as taken from the nest. My five-year-old Dorcas hen commenced to lay the 4th of last December, and is still laying without showing any signs of becoming broody. This hen comes as near to standard requirements as any hen I ever owned.

Your very truly,

(Signed)

GEO. H. BODFISH.

To receive such a letter from a veteran breeder of over 30 years standing should be convincing evidence that the Regal Dorcas strain is the ideal fowl. They are wonderful layers of rich brown eggs, unsurpassed as a profitable table fowl and able to go into the show room and come home with the blue ribbons. What more could be desired?

3,000 matured or rapidly maturing cockerels and pullets of royal lineage, ready for shipping on short notice.

2,000 Selected Cocks and Hens, tested breeders at Special Prices.

200 Acres devoted to White Wyandottes.

Free—Send for illustrated Catalogue and Fall Bulletin, telling all about my special offerings for the next sixty days.

John S. Martin, Box 51, Port Dover, Ont., Can.

Big Buff Minorcas

with their robust size, splendid type and large egg producing capacity are so practical and their glorious golden color so beautiful that they will eventually dominate the Minorca field. Since they are so satisfactory as a fanciers fowl their practical superiority should prompt an immediate investment in a quality foundation mating.

Can furnish outstanding exhibition and breeding males, females and pens which surely will improve any flock.

GREYSTONE, YONKERS, N. Y.

cents. In New York, Oct. 4, 1922, heavy fowls were quoted at 27 cents; fancy heavy, 1 to 2 cents more; fowls, poor, 20 to 22 cents; Leghorns, 20 to 22 cents.

These are the facts, recorded here without prejudice on our part. We are just as willing and ready to show that the Leghorn eats less feed in the course of a year, that it loses less time in broodiness, that it produces a white shelled egg which commands a premium in some markets. It is equally important, however, as a matter of fairness, to admit the advantages of a beef or dual-purpose hen over a dairy hen, when the two carcasses ultimately reach the market.

Why should there be the difference in price between small and big hens? The Leghorn man will say that "a four pound chicken is about the size demanded by the average housewife," and he will intimate that the Leghorn is a big chicken done up in a small size.

In regard to size; few Leghorn hens go on the market at four pounds. They go on the market after the laying season, when they have laid themselves out, are thin in flesh, and the molt is beginning make added demands on their small reserves of flesh and fat. One of the big packers says that the average of these hens in the summer time, as they are culled out of the laying house for market, weigh less than three pounds each.

The Leghorn is not a big kind to start with. It is a bunch of nervous energy, with big intestinal tubes. You can only get about so much flesh on the frame, and then the very temperament of the hen dictates that the surplus food shall be transformed into eggs, not meat. When the question of increasing Leghorn weights came up at the Knoxville A. P. A. meeting, some one said: "You will not make a meat fowl of them if you double their weights." It was at that time that A. C. Robertson furnished to A. F. Rolf, secretary of the National White Leghorn Club, the following tables of weights on the S. C. White Leghorns that were placed under prizes at the last Ottawa, Canada, winter fair:

	Cocks	Hens	Cockerels	Pullets
	Pounds			
1st prize	4.8	3.6	4.4	2.8
2nd prize	4.2	3.2	4.2	2.9
3rd prize	4.2	3.5	4.5	...
4th prize	4.2	3.9	4.5	2.9
5th prize	4.9	3.0	4.2	3.4
6th prize	5.3	3.2	5.2	3.5

The above birds when weighed were not only picked specimens, but were in good flesh. The impetus given the Leghorn breed by its unique ability to adapt itself to machine methods of modern egg farming has resulted in an increase of Leghorn hens on the market. Packers do not like them. The packers, therefore, come in for a lot of blame. A saner view of the situation shows the packer to be no more than a big middle man. The price he pays is established by the demands of the consuming trade.

On June 26th, one of the big packers was selling boxes, each containing a dozen dressed hens that ran 31 to 36 lbs. the dozen, at 25 cents a pound. At that same time a box of a dozen hens that weighed 55 to 66 lbs. sold at 29 cents wholesale. Two weeks later the box of a dozen light hens was quoted at 23 cents, and the box of a dozen dressed heavy hens at 28½ cents.

What made that box of a dozen light hens that was piled up in the refrigerator rooms drop 2c a pound? There is only one answer: The law of supply and demand. Let us apply this law to a section like California, where the supply of Leghorn hens is excessive, and the demand for Leghorn carcasses is limited; the price must fall to that point where the supply available will be consumed. That is always the case, and as the supply of Leghorns increases, the outlet must either be increased or the price will fall. The hotel and restaurant trade insist on heavy fowls for slicing and sandwich purposes. The Jewish trade insists on chickens fat. The average housewife does not consider a thin carcass economical for cooking. And the packer does not want a nervous temperament to put into his feeding batteries to fatten. In all this, not one word is said

against the Leghorn as an egg machine.

Leghorn breeders who feel that they are being discriminated against should consider the following figures, as a sample of the facts relating to this case: It costs 5 cents to pick a fowl. If the hen weighs 5 lbs., that is 1 cent per lb. for picking. If the hen when dressed weighs $2\frac{1}{2}$ lbs., it is 2 cents per lb. for picking. In short, if the packer handles 1,200 lbs. of poultry, he has more expense in buying, dressing and handling 400 little hens than in putting 200 big hens through his plant.

When it comes to Leghorn broilers, one of the big packers remarked "they make fine fowl at $1\frac{1}{2}$ lbs. indeed, if it were not for Leghorn cockerels at $1\frac{1}{2}$ lbs., there would be a shortage of broilers, for farmers keep their chicks of the larger breeds to feed out to heavier weights. The difficulty with the Leghorn broiler is peculiar to our industry. We do not handle poultry the way we did twenty years ago. We now do a great deal of milk feeding. The Leghorn cockerels are apt to show a bluish tinge to their skins. They do not feed as well—they haven't the growth impulse. We do not want them, and to get the kind of broilers we can make a profit on, we pay a premium for chickens of the heavier breeds. But, at that, a Leghorn broiler can be made a toothsome meal when handled in the local market. The Leghorn hen, however, is the difficulty; a nervous, rundown machine cast off after relentless wear. When such stock is thrown on the market in the summer, we, as agents between the producer and the consumer, expected by the producer to buy everything at a top price, and expected by the consumer to sell cream at the price of skim milk—I'll say we are up against it. Those thin hens at 3 lbs. are not a half of a 6-lb. hen. I can't give you the figures showing the proportion of edible meat on each, but if you buy one of those thin, light hens, cut off her head and legs, draw her entrails, and you will find very little meat on the carcass. The consumer does not eat the offal; he wants something on the carcass and a little fat inside. It is a case similar to beef or dairy cattle, only in poultry you have gone along so long on the basis that every breed is 'the best breed' that it is rather painful to face facts, figures and actual conditions that exist in the poultry trade."

We will stop here, letting the packer have the last word, since he stands at the door of the slaughter house, wherein all hens finally enter and are weighed in the scales of supply and demand.

1881-1922

Forty-one years is a long time to be identified with one industry, and it is bound to bring to a man fame when he devotes all those years honestly and unselfishly.

Such is the record of J. H. Drevenstedt, one of the greatest fanciers and judges America has ever known.

The friends of Drevenstedt are legion. For forty years he has been doing for others. He has asked nothing for himself.

When the politicians said: "I. K. Felch must be defeated for president of the American Poultry Association," it was Drevenstedt who replied, "No, the honor belongs to the father of the pure-bred industry." Felch was elected.

Friends of J. H. Drevenstedt are now supporting him for vice-president of the A. P. A. to succeed Harold A. Nourse of Minnesota, who has held the office for two terms, and now wants a third term.

There are fanciers of the old school who feel that it would be a great credit to have a man like J. H. Drevenstedt as one of the heads of the American Poultry Association, and that inasmuch as he has done so much for the Standard-bred industry, he should be elected as a token of appreciation and respect. The following telegram addressed to Editor of American Poultry Journal, and filed at the Western Union office during the Tri-State Fair at Memphis, Tenn., voices the attitude of three good fanciers:

"We, the undersigned, interested in the welfare of the American Poultry Association as a breeders' organization, endorse J. H. Drevenstedt for vice president as a token of

HAROLD TOMPKINS RHODE ISLAND REDS

Grand Exhibition Birds and Breeders

NOW ready for the show room or breeding pen. Each bird possesses that oblong body, Standard black markings and rich, red color that makes them very popular with the judges and exhibitors.

In addition each bird carries not only the blood of many generations of prize winning ancestors but the improvements refined and perfected by the accumulated experience from years of constant effort in producing Rhode Island Reds superior to all others. The results of these efforts have been demonstrated by the ever growing strength of the winnings of this strain in years past and the phenomenal achievement last season at Boston and Madison Square Garden, the leading shows of the world, where twenty blue ribbons were won out of a possible twenty-four and 130 birds won prizes out of my total exhibit of 153.

Customers Vouch for Their Merit

In addition to this great record made by these birds in my hands, thousands have been furnished customers all over the world including those in Africa, Argentine, Denmark, England, Holland and Japan. Many reports are received from these customers from time to time which show the satisfaction and pleasure obtained by buying birds from this strain. Some of these reports are quoted in my Premium List others will be furnished upon request.

Profit by This Opportunity

Due to my great winnings last year my showing this season will be somewhat restricted. This will allow me to give my customers the benefit of birds that ordinarily I would need for my own exhibits. I can furnish show birds both old and young that will please every reliable judge at any show. All birds are exactly as represented and square treatment is guaranteed every customer.

Write and let me help you.

WIN WITH HILLVIEW LEGHORN

We guarantee they will win
in any show in the country
regardless of competition

Win Your Way Among America's Successful Breeders

Many of America's money making White Leghorn farms today owe their success to Hillview Supreme White Leghorns, simply because their investment was made on a Solid Foundation Stock, backed up with many years of constructive line-breeding, and many years of glorious unapproached winning records in America's largest Show Rooms, and National Egg Laying Contests.

OPPORTUNITY KNOCKS AT YOUR DOOR

We offer thousands of Cockerels and Pullets, the better never raised on any other place and at no time. All Sons and Daughters of our Coliseum Chicago Sweepstakes Champions and Egg Laying Contest winners at prices you can afford to pay. You need Hillview blood to improve the exhibition and laying quality of your flocks. You need Hillview outstanding, money-making world's best combination strain to succeed. Make no mistake. Send for our Free Catalog today. It will show you how you can buy the best White Leghorns in America today for much less money than you can buy just ordinary stock.

HILLVIEW FARM
Box 4004 Benld, Ill.

J. H. Drevenstedt in his garden at Plandome, Long Island, New York.
See editorial headed "1881-1922."

respect and appreciation of the unselfish and untiring efforts he has put forth in uplifting the American fancy." Signed:

"A. H. Emch, Toledo, Ohio.

"Frank F. Conway, Hinsdale, Ill.

"T. W. Schoen, Laurel, Miss."

Theo. Hewes recently wrote us: "It is about time we were remembering these old heads, and I, for one, would like to see this spirit revived. Make the office of vice-president a sort of honor position, so the boys can look up to it with pride, and let the younger members feel that it is up to them to make their work count so that they may be in line for recognition and honors when the proper time comes."

Mr. Drevenstedt is not a "candidate" for the office of vice-president. He will make no campaign and ask for no votes. But he has stated that if he could be of any service to the association and his friends wished to nominate him, he would accept the call.

That is what is needed; men who are not

candidates, but men who have the capacity and willingness for service.

It seems appropriate to elect one executive officer from the East. The East is entitled to recognition. Practically all the officers and members of committees of the A. P. A. are from other parts of the country.

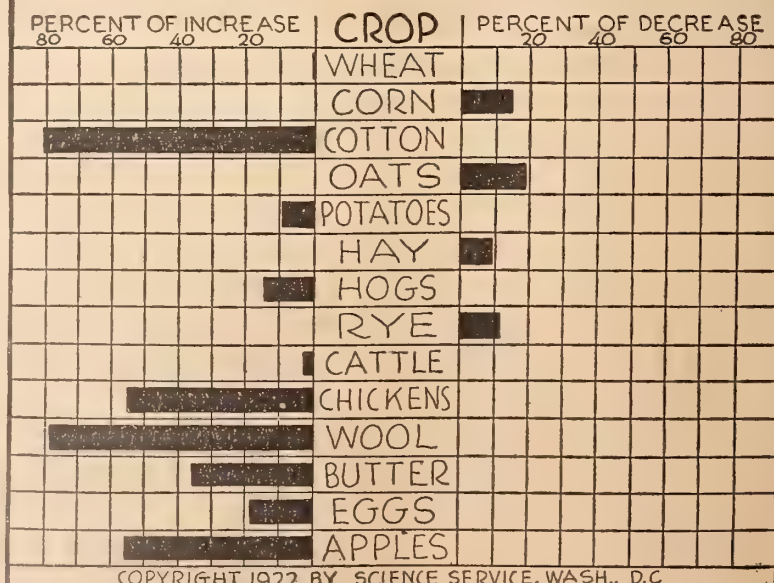

The next meeting of the A. P. A. will be held in Philadelphia next August. It would be fitting if an Eastern vice president could be inaugurated into office at that time. J. H. Drevenstedt is the choice of the East. It would revive the old fanciers' spirit to call him to the chair.

Withholding Prizes in Shows

The very first general disqualification listed in the Standard is, "Specimens unworthy of a score or lacking in breed characteristics" shall not be awarded a prize. Then the Standard instructs all judges that specimens to be entitled to win a first prize

Requires The Least Attention— Produces The Strongest Chicks!

EVERY SEASON the Candee gives added proof that Candee-hatched chicks are the quality chicks that live and grow. Today the Candee continues to stand supreme in these essential features:

True Sectional Construction—making it the easiest to install and to enlarge without loss.

Patented Double Heat Control—assuring double protection against overheating.

Automatic Egg Turner—by which all of the eggs can be turned in from two to five seconds.

Double Deck Construction—permitting large installations in small space.

Positive Cooling of Eggs by opening the compartment doors without overheating other compartments.

Thus the Candee requires the least time and attention, and its record of results shows that more Candee-hatched chicks are raised to maturity, which is the supreme test of incubation.

The Candee Superior Features

The Candee, with its patented double heat regulation, bars the surplus heat from each egg chamber, as contrasted with all other types where all of the heat is piped through the egg chambers and the overheated air allowed to escape, carrying the natural moisture with it.

Eggs can be cooled, if desired, in the Candee (and the most successful operators practice long cooling) in contrast with other types where cooling is impossible.

In the Candee double deck each deck has its own heater, and each deck is a complete separate machine. This results in economy of operation, assures safety and prevents the hottest water from rising in the upper deck at the expense of the lower deck.

A Record of Years of Use

A Candee installation has back of it the record of success of thousands of users in the United States and Canada, and several foreign countries.

The Last Word in Refinement

The 1923 model Candees are equipped with the simplest, most practical egg turner yet devised, one master lever on each side of the machine turns all of the eggs needing turning. Any tray can be disconnected in an instant and it will remain stationary or can be removed.

Start With Any Size Candee

Candee sections contain two 300-egg compartments, each of which can be set and run at different times. The smallest size Candee is a heater and a 600-egg section. The next size is a heater and two sections, 1200-egg capacity, etc. All of the sections exactly fit and more can be added at any time. When the heater becomes too small, a larger heater is supplied free with the extra sections.

Every size Candee is a proved success. Any size can quickly be installed by any handy man. The sections will go through any ordinary size door.

Send For Our Free Catalogue

This is an instructive book, explaining the Candee principles of incubation, showing pictures of hundreds of successful poultry plants.

Anyone planning to sell Baby Chicks or to do Custom Hatching should send for this large free catalogue.

CANDEE INCUBATOR & BROODER CO.

Incubators, Brooding Systems and Colony Brooders

Department 2

Eastwood, New York

From a photograph of a Candee double deck 20,400 egg capacity. Equipped with Automatic Egg Turner, and with it all the eggs needing turning can be turned in two to five seconds time. Cooling of the eggs is done by opening the doors. The only time the eggs are handled is in testing out the infertiles.

CANDEE COLONY BROODER

Broods up to 500 chicks in one flock in one building, with only one heater and one coal fire to attend. Big and quick heating. Its coal magazine, big fire bowl and large 12-inch grate keep the fire burning over night and all the time.

U. R. FISHEL,

Box A,

HOPE, INDIANA

must score 90 points or more, except in the case of cocks of parti-colored varieties, which "may be allowed" to win first prize provided they score 88 points or more.

The Standard safeguards the prize list by first eliminating birds of inferior quality, and, secondly, by specifying that the birds must be nine-tenths perfection before they shall win a first prize.

Judges who apply the standard law are to blame when inferior birds stand under the blue ribbons. The Standard does not give them permission to say, "Oh, there is no competition." In point of fact, the Standard rules require that if a bird scores 89, the first prize ribbon shall be withheld and the second prize awarded, it specifies that if the bird scores 88 both 1st and 2nd prize ribbons shall be withheld and a 3rd prize awarded. Those are the rules to be interpreted in no other way, and they apply under comparison judging as well as score card judging. The reason is to make a first prize mean something, stand for something, whether it is awarded in Podunk or at the New York State Fair.

With these thoughts in mind, we referred in our report of the New York State Fair to the advisability of withholding prizes from birds of mediocre quality. Upon reading that report, Walter C. Young, who is doing as much judging and doing it as well as any man in the country, wrote:

"Just finished your fine write-up of the New York State Fair, and must say you gave your readers real up-to-the-minute information. I heartily agree with you that it is time for judges to refrain from placing awards on all specimens not worthy of a premium regardless of whether there is competition or not.

"This season I have thrown out several birds which were not worthy of winning in any show.

"Just a week ago I refused to place a pen of light Barred Rocks in the money on account of the poor quality of the birds shown. This is the first time in my judging experience that I have thrown down one of the most popular American breeds on account of quality. But I believe the Standard poultry business has got to the point where judges must uphold the quality of all varieties, in order to educate the beginner to breed from birds which will measure up to the quality set down in our Standard.

"On more than one occasion have I had to do this in the Brown Leghorn classes, especially at our county fairs. It is at these smaller shows that judges should hew close to the line in placing their awards if we are going to accomplish the greatest good for those starting out in the Standard bred poultry business.

"Only recently I have informed the breeders at shows previously to my judging that I positively refuse to place birds under the ribbons which are not worthy or in good physical condition. At these smaller shows there are breeders who feel their birds should be placed regardless.

"So I say I will not place any bird which does not 'handle' in good physical condition. Many of the string fellows over-show their birds and get them out of condition and still they are under the impression that they should still keep winning whether there is any competition or not.

"I judged at the Kentucky State Fair recently, and must say it was the best poultry show ever held in the State of Kentucky. Reds were a wonderful class, real quality all through; 292 Single Comb Reds on display. And the best quality I have ever seen at a fall exhibition. In fact this was the hottest Red class I have handled outside the Coliseum. Barred Rocks were out in numbers with the quality high; 282 birds, so you see these two popular American breeds are still leading in numbers as well as quality, and I believe we are going to see some wonderful classes in these varieties at the coming winter shows."

No judge helps a breed by putting prizes on inferior specimens in order to encourage the breed. Good quality, not prizes, are the meat of breed popularity. Two hundred and ninety-two S. C. Reds at Louisville; and

Vaccinate Now

for the Prevention and Treatment

of Roup, Chicken Pox, Diphtheria, Canker, Colds, Catarrh, Cholera, etc.

Vaccination is the one safe, inexpensive and scientific method of controlling these diseases. It reduces losses to a minimum and saves a large percentage of birds already infected.

Read what A. S. L. Avian Mixed Bacterin did for this breeder. It will do the same for you.

The LaBelle Poultry Ranch Co.

Aurora, Colorado
Feb. 25, 1922.

American Scientific Laboratories, Inc.,
Chicago, Ill.
Gentlemen: The effect of A. S. L. Avian Mixed Bacterin upon my Roupy fowls was marvelous. With the exception of a few of the worst cases I can truthfully say that recovery is complete and cure practically is being very rapidly secured. One of my neighbors has also been troubled with Roup and his losses have been heavy. Last Tuesday I asked him to vaccinate his flock and Saturday he called up to say that his birds were O.K. with the exception of two and that he gathered more cases since treatment than even before. Needless to say he is also an A. S. L. worshiper.
I have not treated my entire flock as yet but I can already see a great difference even in the apparently well stock. I am glad, indeed, to recommend the A. S. L. products. Yours very truly,
E. G. Swedberg, Supt.

THE ORIGINAL A.S.L. Avian Mixed Bacterin

is produced only by the American Scientific Laboratories, Inc., under Veterinary License No. 165, issued by the U. S. Dept. of Agriculture. 60 doses, \$2.00; 250 doses, \$5.00; 500 doses, \$7.50; Syringe and Needles \$1.50, postpaid, with full instructions. Properly stored, A. S. L. Bacterin will retain its potency until the date shown on package—two years from date of manufacture.

FREE New customers ordering both syringe and bacterin (any size) will be given FREE a \$1.00 package of GALLI-CURA TABLETS, the real White Diarrhea and other bowel disease preventive.

Start the season right. It will pay you to vaccinate every bird you own. Write for FREE Booklet on Vaccination.

average
PURINA HEN

The average hen in the U. S. lays about 72 eggs per year. The average Purina-fed hen lays about 148 eggs per year. The perfect balance of ingredients in Purina Chows makes the difference.

In which class are yours?

Whether your hens lay 50 eggs or 200 eggs per year, Purina Chows will make them lay more. The extra eggs pay the difference in the feed bill, and give you a fine extra profit.

What Purina-feeders will tell you

A successful Illinois breeder writes us: "For a while recently my dealer was out of your feeds and my hens dropped off immediately about 50%, which they regained shortly after I started again on

your feeds. I would not be without your feeds if I had to pay twice as much for them as any other poultry feeds." This letter is but one of many, which show why it is possible to offer

More Eggs or Money Back

When Purina Chicken Chowder and Purina Hen Chow are fed according to directions, they are guaranteed to produce more eggs than any other ration or the money paid for both chows will be refunded.

Make every day count for your poultry profits. Call your Purina dealer today. If you don't know his name write to

SABRINA Standard Bred Heavy Laying White Wyandottes

WELLESLEY, MASS.

November 1, 1922.

Dear Sir:

In reply would say we have a large number of vigorous, healthy pullets now ready to lay which would make the very best of winter layers, as they will be right in their prime during the hardest laying days. They are priced at \$4.50 each, 25 for \$100, and we can assure you that they are just what you are looking for, as they are well fed, range-grown birds of uniform Standard type, and should prove wonderful layers. They are sired by cockerels whose dams had records ranging from 180 to 220 eggs per year, with generations of high egg producing typical Standard type Wyandottes back of them and can be depended on to make a fine foundation for future breeding work.

We are mailing you a catalog and complete price list should you also be interested in cockerels, breeding pens or exhibition stock, in all of which we can give you splendid value.

Yes, our birds are all State tested and free from White Diarrhea.

Yours truly,

ARTHUR H. SHAW,
502 Grove Street

two weeks later, 308 S. C. Reds at the Tri-State Fair, Memphis. There are not ribbons enough to go around in such classes. But good quality under the ribbons inspires and encourages the breeders.

It is the judge's job to insist on quality and to reward quality. In other cases he should enforce the law.

Australorps

The Australian Black Orpington has attained world-wide fame for its production qualities. Records of 300 eggs and more have been reported. At present many Black Orpingtons are being exported from Australia to England, the home of the breed.

G. E. Andrews, one of the oldest breeders and fanciers in Australia, writes us: "It may interest you to learn that in addition to the Australian utility White Leghorn we have produced a wonderful utility Black Orpington. Hundreds are being shipped to England, where they have named them 'Australorps.' They are more popular than the White Leghorn and are beating them as layers. They are a closer feathered and, of course, a more active breed than the exhibition Orpington. They are medium size and old experienced breeders are making a very handsome fowl of them."

In both Australia and England exhibition Orpingtons are very large and extreme in feather. An English judge and critic, C. A. House, at the recent Ottawa, Ontario, fair, noted the cleaner lines of the American type, and writing to Poultry World, London, said: "Orpingtons made a great show and were most skillfully handled by Mr. Oke. I quite believe all the nice things I heard about his ability as a judge at Vancouver and Toronto. He certainly is a past-master in the use of the judging stick. He knows what he wants and goes for it. The Buffs were really beautiful. Those three pullets of Mr. Clark's which stood 1, 2, 3, were gems for color, type, and feather. Taking the section as a whole, the birds compared favorably with our best in everything except size, and this, possibly, as in the Wyandottes, is more apparent than real, because the birds are so much tighter in feather. The Blues were the weakest in shape and color."

C. A. House, author of the above comment, was passing through Canada on his way to England after several months judging in Australia. During his sojourn in the South Pacific he made quite a study of Australian Black Orpingtons. He spoke of them as a "conglomeration of breeds," saying:

"When I left England nearly five months since I knew little about the Australian Black Orpington, and one of the things which I set out to be educated in, and one

Soon Ready to Mail!

My "30-Year" Poultry Book—

Harry Johnson
"The Incubator Man"

Give Me Your Name, I'll Send You a Copy Free

Soon the presses out in our print shop will be running off the final pages of our 1923 annual Old Trusty catalog and poultry guide. I call it my "30-Year" poultry book because that's the best name I can think of for what it contains. (I'll be glad to have you suggest a better one.)

In it I have crowded the best, most practical and helpful suggestions on poultry raising that 30 years or more could pick up. I am not going to ask you to send me anything except your name. My book is free. I want every poultry raiser to have a copy. I want you to know the Johnson ideas of making money with chickens, geese, ducks or turkeys.

Thousands of books have been written on the subject of poultry, but this is the only book, so far as I know, that treats the subject from the money-making standpoint.

Send Your Name Today

In this book, I also tell you about Old Trusty Incubators, but more than anything else I tell you about the money side of poultry raising. After all, why should one raise poultry if not for profits? But send for the book and see for yourself.

Old Trusty Better Than Ever

More than a million Johnson-Made Incubators in use, and every year sees Old Trusty out-sell any other incubator by several times. Why?

Because Old Trusty takes the work, worry and watching out of poultry raising. It shells out high average hatches of strong, healthy chicks. No guesswork with Old Trusty—when you give it a filling of good fertile eggs you know just what the results are going to be. Four handy sizes old Old Trusty and all have my new 1923 improvements, such as pure copper hot water heating system—easy sliding substantial trays—patented ventilation tubes and clear California Redwood case—each size a quality machine all the way through.

Mail the Coupon or a Postal Today

Or better yet, write me a letter and tell me about your poultry troubles if you have any. I like nothing better than getting a letter telling what the writer expects to do next year with poultry. We always answer such letters in full, too. Our letters are helpful and full of our own experience in raising poultry. Send me your name so we can send my new catalog and write you once in a while. Send your name on a postal or the coupon NOW if you cannot write today. Yours for a big success next year—

Harry Johnson, "Incubator Man."

World's Greatest Poultryman Joins National Poultry Institute

Harry M. Lamon, for many years in charge of Poultry and Egg Investigations for United States Government, becomes President of World's Largest Practical Poultry Correspondence School.

MR. LAMON was attracted by the remarkable success of THE NATIONAL WAY of teaching How to Raise Poultry for Profit.

NO LIVING MAN has had the whole poultry experience of Mr. Lamon; the whole United States has been his friend; he established the largest, best equipped and most successful poultry experimental farm in the world—The Government Poultry Farm at Beltsville, Maryland; he developed the greatest poultry producing organization the world has ever known; he has the distinction of being the only man whose name was ever officially designated by the United States Government to a Breed of Poultry—the "LAMONA," which breed he originated. His writings on Poultry Production are accepted as standard authorities by leading educational institutions.

Harry M. Lamon
President

Why Mr. Lamon Joined The National Poultry Institute

SERVICE! The National Poultry Institute, teaches men and women, boys and girls, "How to Raise Poultry for Profit" by correspondence. It starts from the beginning and covers every detail necessary to Success; its field is the World; it has students in 48 states and 29 foreign countries; it maintains a Personal Service Department and carefully follows the work of each student; its methods are clear, simple, and easy to follow; it actually teaches by correspondence in such a way that any one who can read can learn to Raise Poultry for Profit.

The National Poultry Institute has the most complete and practical course in Poultry Raising ever published, and it has the largest group of practical, experienced poultry authorities on its faculty that has ever been organized for poultry instruction by correspondence. This Institute is rendering an immense service to the poultry industry all over the world. THAT IS WHY MR. LAMON, THE MASTER POULTRY BREEDER OF THE WORLD, HAS JOINED THE NATIONAL POULTRY INSTITUTE.

You Can Raise Poultry For Profit

YOU CAN! You have only to make up your mind; it is easy to learn; the method is plain and simple. The results of the years of study and experience of Mr. Lamon, and of the great faculty of the Institute, has been boiled down and carefully outlined so that you can grasp in a short time the great facts which others have toiled and sweated for years to obtain. Success is a matter of KNOWING HOW, and the years of effort which these great poultry authorities have expended to make success SURE have been combined FOR YOUR BENEFIT.

Read What Others Say

"YOUR COURSE HAS SAVED ME MONEY," writes Mr. Frank G. Woehr, of Herbertsville, N. J. Mr. Wm. S. Bardwell of Portland, Oregon, writes: "I am confident that your course is the BEST and really the ONLY way to learn the poultry business." "YOUR COURSE CONTAINS A MINE OF INFORMATION" writes Mr. Owen Sehorn, Snohomish, Washington. Mr. Karl Muller of Philadelphia, Penn., writes "Your lessons are so clear a child can understand them; the illustrations are splendid." WOMEN, ALSO, ARE MEETING WITH GREAT SUCCESS. Mrs. J. E. Ortseifer, East Liberty, Penn., has had remarkable results: "After following your advice with our last hatch," she writes, "we didn't lose a chick. WE FIND IT PAYS TO RAISE POULTRY, AND WE OWE IT ALL TO YOU."

Every Day, Every Mail, from every State in the Union, stories of SUCCESS flow in; Success breeds Success; the poultry industry beckons to you; YOU CAN RAISE POULTRY FOR PROFIT. TAKE THE FIRST STEP NOW.

SEND FOR THIS BIG FREE BOOK

Get the facts. This book tells all about the big Opportunities in Poultry; it tells you WHY WE INSIST THAT YOU CAN RAISE POULTRY FOR PROFIT when you KNOW HOW, and WHY WE CAN SHOW YOU HOW. It answers every question you have in your mind NOW as to whether you can succeed, and it POINTS THE WAY TO YOUR FUTURE SUCCESS. SEND FOR THIS BOOK TODAY; NOW! A POSTAL WILL DO—BUT DO IT!

THE NATIONAL POULTRY INSTITUTE
DEPT. 111-L, WASHINGTON, D. C.

HOW TO
RAISE POULTRY
for
PROFIT
NATIONAL
POULTRY INSTITUTE

of the things which I fully believed my Australian tour would teach me, was greater knowledge of the Utility Australian Black Orpington. Amongst those whose stocks I have seen and handled are some whose sole idea is the production of a bird that will lay a phenomenal quantity of eggs, and who have little thought or care as to the shape or size of the bird that lays the eggs. They trouble nothing about type, yet call their birds Black Orpingtons. I should give them another name. They are black fowls, they lay eggs, but they are not Black Orpingtons.

"In some yards I have visited and in the competitions I have seen birds which in color only resembled the real Black Orpington. I have seen birds with combs far too large, combs that would do credit to the Minorca, others I have handled have carried combs more like those of the Langshan. In this point alone have I seen the two extremes. Then in eye there have been wide differences. Many birds have the red eye of the Plymouth Rock, others have the dark brown, approaching the black of the Orpington. Then quite a large number that I have seen have white in lobe, and some have more white than red. This looks more like the Minorca than Orpington. In size I have seen marked divergence from the Orpington standard. Mature birds which would not pull the scale at 5 lb., others which would go 6½ lb. to 7 lb., few are the latter, the bulk of those I have handled would come in between the weights I have given."

"In shape some come near the Orpington with good fronts, fairly short backs, and not great length of leg, others show the Minorca in length of back and the angular carriage of tail instead of the curved back and nicely rounded low tail of the Orpington, while some have the higher curved tail of the Langshan. There are those which have the gay, sprightly carriage of the Minorca, others which have the more sober, steady gait, and tread of the Orpington. I have also seen feathering on the legs and between the toes. In neck some are longer and finer than the Orpington should be."

"Rich deep black with brilliant beetle-green sheen is the color that standard or exhibition Orpington breeders seek to obtain. Many of the utility Black Orpingtons are a dull bluish black with purple sheen, whilst in more than one I have seen traces of barring, and I have extracted feathers, odd ones, it is true, that were very distinctly barred with wide, dark, blue black bars on a lighter blue ground."

"All these things have led me to the conclusion that in the production of the so-called utility Black Orpington Australian breeders have utilized the Chinese Langshan, the Minorca, and the Plymouth Rock, and that the bird as it exists today in many yards is an Orpington-cum-Chinese-cum-Langshan-cum-Minorca-sum-Plymouth Rock. There are some of the breeders who agree with me."

"Recently I was discussing this question with Mr. A. G. Greenwood of Ryde, who has for many years been one of the foremost authorities in New South Wales on the exhibition and also the utility Orpington, he having bred many thousands of each, and consequently a man whose opinion is worth having and worthy of the deepest and fullest consideration. What is that opinion? It is this: 'Certainly we have evolved a most useful fowl, one that gives an extraordinary egg production, but it is not an Orpington, and it should not be so called. Some years ago I suggested it should be known as The Austral, but nothing was done. But the bird as we know it now should be named and standardized.'"

Australian breeders are endeavoring to standardize their utility Orpingtons, by deciding on correct weights and the amount of feathering their birds should carry. They realize the need of establishing these points for the benefit of buyers, judges and breeders alike. English breeders are also endeavoring to establish a standard. They have given the birds the name of "Australorp," a term the Australians do not like. The English are uncertain about what weights to set. Powell-Owen suggests 4½ lbs. for pullets with a maximum of 6 lbs. for hens. The Australians prefer a weight of 5 lbs. for

BREEDERS OF

HIGHEST GRADE

PEDIGREED S.C.W. LEGHORNS

THE KIND THAT LAY AND PAY

HOLLYWOOD, WASH.

Four of the 1st five winning pens at Second Western Washington Egg Laying Contest were pure Hollywood Strain, one of our own entry, and three by cutomers. These four pens laid 5,300 eggs, an average of 265 eggs per pullet.

Mr. Poultryman:

Do you realize that the male bird is the most important thing you have to deal with in your business?

THAT upon your breeding males rest the responsibility of the amount and size of eggs your flock will lay;

THAT the use of sires from high producing ancestry is the only guarantee of continued high production;

THAT in the sire from proven ancestry all the factors affecting egg yield in the germinal constitution are pure for high production, consequently they can only transmit high production to their offspring;

THAT these factors are also dominant over factors for low production, so that even though they may be mated with females that transmit

low production the resulting female offspring will give high average production;

THAT the average egg production of hens in the United States is far too low;

THAT economy, competition and the desire for profit demand improvement;

THAT the surest and most economical way is to use sires with trapnest records back of them;

THAT in one year their progeny from increased egg production alone will repay you twenty to fifty times the purchase price, and in addition will give you many valuable breeders.

ALL the above statements are **FACTS** and it will pay you, and pay you well, to be governed accordingly in **YOUR** poultry work.

The Greatest of All Laying Strains

By our thousands of satisfied customers and our winnings year after year, for six straight years in numerous official egg-laying contests, we have proved absolutely that **HOLLYWOOD** has the greatest of all laying strains. This unequalled record has been made by us, not with one or two winnings in dozens of trials—up one year and down the next—but by consistently winning, year after year, in all parts of the United States, from ocean to ocean. **HIGH AVERAGE EGG PRODUCTION SHOULD BE THE GOAL OF ALL POULTRYMEN.** Let us help you reach that goal by selling you your breeders for 1923.

Breeding Stock and Layers For Sale

We have the finest lot of Breeding Cocks, Cockerels, Hens, Pullets and mated pens ever offered by us. All of them are closely related to our Contest Winners.

[We solicit your patronage and if favored with it will surely satisfy you. We are as anxious as our customers can possibly be that our strain makes good in their hands. We know that upon the success of our customers rests our success.]

M.D., D.V.S.

six months old pullets and 7 lbs. for cockerels.

The old fanciers of England have not taken up the Australian utility Black Orpingtons to the exclusion of the English exhibition type. In fact, the importations from Australasia have brought forth some criticism from died-in-the-wool fanciers of old England, particularly because the Australorps lack so much of Orpington quality. In defense of the breed, E. A. Taylor, secretary of the newly organized English club devoted to the Australian Black Orpington, writes:

"It is said that some breeders of Australorps admit they have introduced Chinese Langshan and Black Minorca blood within their strains. Whilst this is obvious in several imported strains, as shown by the distinctive type amongst some hundreds of specimens of those strains over here, other Colonial breeders claim that their strains are pure and true to the originals. As the late Mr. Wm. Cook produced the original Black Orpington by selective crossing of the breeds mentioned in addition to the Black Rock, any subsequent re-introduction of fresh blood of either of those breeds, when pure, would not be cross breeding, but quite permissible under the circumstances. We must remember that they have bred the Black Orpington for 40 years true to the original type, and to have improved its prolificacy until they hold the whole world's laying records of today. The very fact that the late Mr. Joe Partington, introduced the show Orpington by crossing Black Cochins with Cook's originals, proves the exhibition birds of today to be less pure and true, and therefore they have less claim to the title Orpington than the Australorp has.

"Our English show type is admitted to be too big, too fluffy, and rounded, too heavy in bone, and short-legged to lay. And so the name Australorp is, as Mr. House said, 'a happy descriptive title' of the useful breed we have imported, as distinctive from the English show Black Orpington.

"As regards the standard, provisionally drawn up by Mr. W. Powell Owen. Most fanciers on both ends of the earth agree upon most of its points, but the questions of eye and lobe color, sheen on feather, and weights are highly controversial. Capt. Pierson Webber calls for the inclusion of up to 50 per cent white in lobe, and the white as well as tinted and brown-shelled eggs, in order to maintain Minorca characters to control broodiness. Our provisional Australorp Club standard states: 'Eyes black, with brown or red iris preferred; plumage black, with purple or green sheen, latter for preference. Weights: Pullets on point of lay 4½ lb., hens around 5½ lbs. Hens over 6 lbs. to be disqualified. Cockerels 6 lbs., cocks 7 lbs.'

"These are the main points in dispute. In actual experience covering many hundreds of imported birds of the most fashionable winning strains, under 10 per cent of adult hens with 12 months' Australian laying records actually weigh over 6 lbs. in good condition. Very few birds exceed 4½ lbs. when about to lay their first egg.

"The majority of imports show red lobes, and the minority with white in lobe, probably because they have all been selected with great care.

"The matter of color of sheen on plumage is fairly described, but it would be madness to penalize an otherwise good bird from a utility point of view because she showed purple instead of green sheen."

J. I. Lyle, secretary of the American White Orpington Club, after spending part of the past summer in England, writes: "I trust that we are spared any resemblance to the Australian Blacks, which seem to be a half way cross in type between a Leghorn and a Wyandotte without anything except a laying capacity to recommend them. I saw a cock bird of this variety at Lord De-war's Homestead Poultry Farm at East Grandstead, Surrey, which I understand was a good specimen of the strain that may have weighed 6½ pounds, not more."

On the other hand, Mr. Lyle is equally emphatic and clear spoken in his denunciation of the over-done English Orpington, and he is very frank to say that all indica-

Brower's Sav-All Chick Feeder and Water Fountain. This Combination Feeder or Fountain is made to fit any pint, quart or half gallon Mason jar. The feed or water is held by gravitation in the jar, allowing only a sufficient amount in the basin. This is the cheapest, most practical and sanitary feeder and fountain ever devised. Prices do not include jar. Prices: 10¢ each, postpaid 15¢; 6 for 55¢, postpaid 80¢; 12 for \$1.00, postpaid \$1.45.

Brower's Sav-All Up-to-date Chick Feeder, Water and Milk Trough with rain top which is adjustable to fit chicks of various ages. Top protects feed from sight of birds. Prevents chicks from getting into trough with their feet and contaminating the feed. Top removable for refilling and cleaning. Made of galvanized iron. Prices with top, postpaid, 12 inches long, 60¢; 18 inches, 90¢; 24 inches, \$1.00.

Brower's Combination Feeder and Storage Bin. This device is a labor and feed saver of the first caliber. Made in two sizes, capacity 100 and 300 lbs. of dry mash, 60-lbs. oyster shell, 60-lbs. pearl grit and 30-lbs. charcoal. Fill up once a month. Hangs 18 inches from floor and gives chickens plenty of exercise jumping to feed. No food lost, none wasted and none contaminated by rodents. Made of galvanized iron: 100-lb. Feeder, length 45 inches, Price \$14.50; 300-lb. Feeder, length 95 inches, Price \$23.50. Freight paid east of Rockies. Used and recommended by government experimental stations.

Brower's Laying and Trap Nests. Most up-to-date Trap Nests on the market; sold under guarantee to give satisfaction or money refunded. Suitable for any size fowl. Trap door absolutely faultless. No triggers or springs to get out of order. Made of galvanized iron. Trap doors are detachable. No. 22-16, 48 inches long, 4 nest size, price complete with trap doors as illustrated, \$4.00. Without trap doors, \$3.25. No. 22-17, 94 inches long, same as above. With doors, \$7.50, without doors, \$6.00. Freight paid east of Rockies, in half dozen lots or more.

We can supply batteries of 8 nests, 48 inches long at \$7.50 with trap doors; 16 nests, 94 inches long at \$14.50 with trap doors.

Trap Nest Front. Make your own trap nests by attaching the trap door to any ordinary nest of wood or otherwise. Can be attached with screws or nails. Absolutely best trap nest front manufactured. No parts to get out of order. Suitable for any size fowl. Price, 60¢; ½ doz., \$3.00; 1 doz., \$5.50; ½ doz. postpaid, \$3.40; 1 doz. postpaid, \$6.10.

Up-to-date Dry Mash Feeder. Entirely sanitary. Cannot clog. Will not waste feed. Will take care of fourteen hens at one time. One size only—5 inches deep, 12 inches in diameter. Holds 7 qts. Made of galvanized iron.

Price, \$1.40, postpaid; 1 doz., \$16.00. Freight paid east of Rockies.

Improved Up-to-date Blue Flame Hover. Our Improved Up-to-date Hover is without a fault as it is absolutely valveless. Perfect oil control. Sootless, odorless, which is required under the hover to raise healthy and vigorous chicks. The ventilator in canopy is so constructed as to permit free circulation of pure air. The burner is assembled on stamped steel base. All working parts are protected with metal shield. The burner is encased with steel draft protectors preventing any draft affecting the operation of the burner. The air is taken in at one end of a steel air duct and is superheated before entering the burner, which is absolutely necessary for proper combustion and is a necessity in an oil burning hover. This burner is also equipped with an oil control governor, which prevents the oil from rushing to the burner when the bottles gurgles, thus preventing flame from flaring and going out. Keeps flame steady at all times. This is a feature only found on our make of hovers. Our burners are all equipped with the celebrated gas defuser lighting ring. Freight paid east of Rockies.

KEIPPER Exhibition YOU WIN Coops Help

Nearly all of the up-to-date poultry shows in the country used Keipper All-Wire Coops last year. The added attractiveness they lend to the exhibits makes the shows a better success financially.

Exhibitors are demanding Keipper All-Wire Coops and give preference to shows where they are used.

Neither the bird nor the shows look right in old fashioned, solid-partitioned coops. The Keipper All-Wire, electric welded, Collapsible Coops are a boon to the fancier.

For conditioning and training before the shows you should have a few of these coops. Then your birds will feel at home in the show room.

Write for **FREE BOOK** of poultry specialties including, egg boxes, shipping coops, trap nests, fountains, feeders, etc. Tells how to condition birds for shows.

Rented to Fairs and Shows with Purchase Privileges

tions are that the show-pen fowl of England has a poor outlook unless something is done to revive the breed. Then Mr. Lyle goes on to explain the reasons why the English Orpington is no longer a utility fowl. He says:

“Now the English fancier wants above everything else a long feather, such as we have seen in the Blacks. They must have a very heavy cushion, especially in the females and the more abundance of fluff in both sexes the better. The back must be short, I believe, because the short bird looks broader and they want width quite as much as we do and probably more. The main tail feathers should not ‘fan out’ like an inverted V which we admire so much, but should lie in close together. The shanks should be short, but this length is made to look shorter than it really is because of the length of the fluff.

“My own experience is confirmed by our best authorities, that the loose feathered, low, short back bird is not active or vigorous and generally not a good layer or as prepotent as our American Standard type. Practically all of the cock birds were in full feather. Their seasons are later than ours, so but few of these birds had begun to moult, while many hens were in new

The sluggish English Orpington, pinched tail, saggy breast skin and all. Photo by courtesy of J. I. Lyle, who visited English fanciers last summer. This pullet won 1st at the Dairy, Palace and Club Shows last season.

feather. I was very glad of this because it gave me the opportunity to see how the English fancier had progressed in eliminating brass in the male color.

“Many of the cocks were being kept housed, while some had free range. Without exception every cock showed brass. For the past three years I have bred each year at least one perfectly stay white male and many other American breeders report birds of this character. If a non-brass, stay white cock existed on these English farms the owner must have been suspicious of us and kept him hidden away.

“So we returned to America with the experience of having met some very lovely people, some real fanciers who, with one exception, treated us with very cordial hospitality. We returned with the knowledge that there are more good White Orpingtons to be found on any one of several American farms than we saw on any one of these farms that are acknowledged to have England's best with the possible exception of John Warren's.

“We American breeders owe quite a debt to our fanciers producing the type of bird that has real commercial value in addition to symmetry and beauty.”

We can all be proud of the fact that the American breeder is well balanced, not much of a faddist, and wants an all around chicken, for it is this fact that has made American Standard bred poultry the most useful and the most beautiful in the world.

POOR MAN'S INCUBATORS and BROODERS

The Poorman Incubator

Each unit consists of two compartments of 500 egg capacity that can be operated independent of each other. Between each compartment is a mixing chamber wherein the OUTSIDE FRESH AIR is thoroughly heated and moistened to the proper degree of temperature and humidity before entering the egg chambers. A natural circulation (not forced by fans) of FRESH, HEATED, MOIST air is constantly maintained without any mechanical assistance. The ease and security of its operation in producing the 100% chick will be to your financial advantage.

You Write the Guarantee

Do you want to produce and sell 100% chicks? Of course, you do. Your careful investigation of all makes of incubators will have only one result,—it will be a POORMAN, the only incubator where the purchaser writes the terms of the GUARANTEE.

A Poorman Colony Brooder House and Feather Hover

The house is eight feet long and four feet deep, a floor space of 32 square feet. It will accommodate 75 chicks up to three months old.

Eight screws secure the four walls. The roof and floor are removable for cleaning and sunning. One man and an assistant can properly operate 60 units with a total production of 16,875 broilers for the season.

This combination of Colony House and Hover is a complete unit for the production of broilers, and from March 1st to October 15th will produce three sets of broilers—225 marketable broilers weighing two pounds.

Thousands of poultrymen are using my Feather Hovers with the utmost satisfaction, many of whom reported absolute failures with heated hovers. Read their letters in my Catalog.

POOR MAN'S TRAP-NESTED 200 EGG STRAINS

18,000

Customers can vouch for the Superior laying qualities of my White and Barred Rocks, White and Buff Orpingtons, Rose and Single Comb Reds, White Wyandottes and S. C. White Leghorns. I am now offering

A Special Pair Mating of White Leghorns

Choice Foundation Stock

in yearling males and females from some of my best matings in the above breeds, at very moderate prices, for immediate delivery. This stock is right in its prime for the breeding season of 1923. The quality is no experiment, and with your careful attention you can be reasonably assured of success, as have hundreds of my customers before you.

Eggs and Baby Chicks

I am now booking orders for eggs and chicks, for 1923 delivery, at pre-war prices.

"Egg Money" will Build Houses

This young man—a boy 15 years old, of Iowa—won the first prize in a recently conducted snapshot contest. In a letter from this young man, which he very neatly "hammered out" on his typewriter—he informs us that "everybody in the neighborhood is interested in my Anconas and I frequently have visitors over here to look at them."

He isn't going to have the slightest difficulty in disposing of all the hatching eggs, baby chicks and stock he wants to sell for a good handsome price. His Anconas will more than send him through college. His Anconas will start him in some other business. His Anconas will help his folks (if that were necessary) to more of the conveniences and comfort of life. What

SHEPPARD'S "Famous" Anconas

have done for me at Madison Square Garden the last 15 years—what they are doing for my customers who report astonishing egg-laying records—what they are doing to attract the attention of people everywhere to their achievements and beauty—THEY WILL DO FOR YOU.

My catalog tells how, simply and economically, you can get started—or supplement and build up your present flock.

CURRENT NOTES AND COMMENT

Coming Poultry Shows

We received during October the greatest number of poultry show dates that has been listed since the war. The poultry show date column in this issue reflects the healthful glow of the purebred poultry business.

* * *

An Egg City

The Chamber of Commerce in Canada announces that an "Egg City," which will accommodate 100,000 layers, is to be established north of Toronto. There will be 500 acres, divided into 75 poultry plants, each owned independently. The estimated productions will be 100 cases of eggs a day. Such schemes usually originate in the office of a real estate promoter.

* * *

White Diarrhea Control

The Indiana State Poultry Association at its recent meeting at Purdue University, passed resolutions calling for a committee to prepare a bill for the Legislature providing for the inspection and certification of stock used to supply chick hatcheries with eggs. The idea is to weed out by blood test hens that carry the bacillary white diarrhea germ. With no infected hen to transmit the specific organism to the eggs she lays, there will be no white diarrhea chicks.

John Bolton of England says that white diarrhea can be cleaned out by mineral feeding. He wants the ash to be water soluble, so as to afford early assimilation. He says that hens which revert to the time of the pterodactyl, are being robbed of the mineral food which was more easily acquired by their ancestors.

* * *

Rufus Delafield Passes Away

Rufus Delafield was buried September 29th, 1922. The funeral was held in Old Trinity Church, at the foot of Wall street, New York. The news of the death of this great fancier came as a shock to the breeders of New Jersey, and Mr. Delafield's many friends in the poultry world. Few men were in his class, as a gentleman fancier. For nearly ten years he took a terrible beating in Orpingtons, year after year, at New York, but he never faltered or gave up; and then the sun began to shine and he won, and won, and won. In defeat he was never bitter; and he never talked about his victories. The past few years Mr. Delafield has been breeding bantams, importing a number of these lilliputians from England. Mr. Delafield was a great aid to the poultry industry of New Jersey, always giving liberally of his time and effort.

* * *

Who Should Write Show Reports

We are pretty careful who judges our birds. His name is announced in the premium list before the show. He is usually a man of wide reputation.

What about the fellow who rejudges the show, who writes about the winners, and broadcasts what he writes the entire length and breadth of the land? Is he qualified to pass judgment, does he know, are his capabilities such that he may be trusted by both the exhibitor and reader?

Show reporting is no longer writing up free reading matter for advertisers. We welcome this new era of open comment on the winners. But we are not unmindful of the dangers of such a system in the hands of the incompetent. Why should not the big shows insist on capable reporters the same as they insist on the right kind of judges, the right kind of coopers and feeders, the right kind of subscription solicitors? Then give those approved reporters some privileges in respect to handling fowls when close inspection is necessary. Let's all try to elevate the show reporting business.

The Rear View

A hen is a wonderful animal machine. It picks up its food with its head. The food goes into the crop, where it is softened. Passes on to the gizzard, where it is ground by the muscular contractions of that organ. The food nutrients then pass on to the intestines, where they are absorbed into the blood stream. The carbon of the food, combining with the oxygen of fresh air that has been breathed into the lungs, is burned at a low temperature, developing the heat and energy necessary to life and activity.

Hens vary in temperament. Some hens by nature deposits the surplus food nutrients in the body as fat. Other hens by their very nature transform the surplus into eggs.

The natural layer has large intestines, and abdomen, as viewed from the rear, is large. There is no accumulation of fat around the intestines, and the abdomen is soft and pliable to the touch.

This White Wyandotte female has the round head and bright eye that indicates egg

The round headed, bright eyed, big barreled White Wyandotte, with wide spread tail, standing on legs well apart.

producing temperament. She has the full, soft abdomen, with nice texture of skin on it. She has a big, moist, faded vent. Her legs are well spread, not long or close together. Her tail is well spread. The Standard says that the Wyandotte's tail should be "well spread at the base." In getting the ideal spread of tail, the width of the back should be carried well back from the hips to stern. This means a wide pelvis, allowing for easy passage of egg. A hen that narrows in from hips to stern may have a pinched tail and lay an egg every other day after an hour or more on the nest.

* * *

Honest-to-Goodness Egg Records

Theo. Hewes writes us that there is a possibility of Leghorn breeders, as a matter of self protection, calling the attention of the postoffice department to paper and pencil egg records, and asking for an investigation for the purpose of closing the mails to some offenders.

The Breeders' Gazette gives some illuminating data on flock records, by citing the number of hens in the different egg contests, the total number of eggs produced by those hens in the course of a year, and the average number of eggs laid during the year by each hen. The figures are as follows: "Puyallup, Wash., 225 hens and 47,400 eggs, aver-

North, South, East and West
poultrymen everywhere are having wonderful success with
Ful-O-Pep Feeds, both with growing stock and laying hens.

Ful-O-Pep Feeds are Best Because

- | | |
|---|---|
| 1 The Oatmeal base is the best possible form of carbohydrates for laying hens. | 5 So thoroughly mixed that the fowl gets a balanced mash in each mouthful. |
| 2 The large variety of proteins is derived from fish, meat and vegetable sources. | 6 Most appetizing because made only from high grade materials. |
| 3 The mineral content supplies every need of the body for growth and egg production. | 7 Steady production and low mortality is insured by uniform quality and unchanging formulas. |
| 4 It is finely ground insuring easy, quick digestion. | |

FUL-O-PEP

POULTRY FEEDS

are the result of scientific experiments which have proven the correct proportion of various ingredients necessary for best results. Manufactured by the largest manufacturers of poultry feed in the world, Ful-O-Pep Feeds maintain a standard of excellence that produces results with feeders so that they are recognized as "the world's best."

EGGS! EGGS!

Group of Ful-O-Pep raised pullets. Picture taken at age of fifteen weeks.

Owned and raised by
W. C. Schroer
Denver, Colorado

EveryDay, All Winter

If you want your hens to shell out eggs this Fall and Winter as they never did before begin now to feed your laying stock the Ful-O-Pep.

Ful-O-Pep Dry Mash will produce every egg your flock is capable of producing—it produces eggs in Winter as well as Summer, because it is made up of the raw materials from which eggs are made. Keep Ful-O-Pep Dry Mash before your birds all the time and they are bound to lay—they can't help it. Read the following letter from F. W. Humphrey, of Edgarstoune Farms, Princeton, New Jersey:

"During my 15 years' experience in the poultry business I have mixed my own mashes and used most all the commercial feeds on the market but none give results like Ful-O-Pep.

"Ful-O-Pep Dry Mash has more than doubled my egg production and keeps my birds in finer condition. Ful-O-Pep Growing Mash produces 2¼ lb. broilers for me in 8 weeks and pullets that begin laying at less than 5 months of age. Ful-O-Pep Feeds certainly do what they are advertised to do."

Results like the above are being obtained by poultrymen everywhere who are following The Ful-O-Pep Way. Give it a trial—the better results will agreeably surprise you.

The Quaker Oats Company
MANUFACTURERS OF QUAKER OATS
CHICAGO, U. S. A.

Partial view of one of the main laying houses, housing 1500 pullets at White Arrow Farm, Newark, S. C., where Ful-O-Pep Feeds are used extensively.

Quaker Oats Company,
Gentlemen: This year we started with 475 chicks hatched from April 1st to May 1st. We fed FUL-O-PEP FEEDS exclusively according to directions and never had chickens do better. On June 19th we began to sell broilers weighing from 2½ to 3 pounds. On August 4th a Leghorn Pullet laid at the age of 4 months and 3 days. Yours truly, (Signed) S. E. TRACY
77 Catherine St., Burlington, N. J.

EGGS! EGGS!

-The Ful-O-Pep Way

Make the most of Fall and Winter egg prices—that's the time to make money out of your flock. You can do it if you follow the Ful-O-Pep Way. Follow the Ful-O-Pep Way to the letter; don't let a few boss hens keep down your egg production—provide one Ful-O-Pep Dry Mash Hopper to every 10 hens in small flocks and one running foot of open hopper or trough space to each 10 hens in laying houses—so each and every hen can get all the Ful-O-Pep Dry Mash they want — the more Ful-O-Pep Dry Mash consumed — the more eggs.

Whether you have a dozen or a thousand hens you'll find the Ful-O-Pep Way the way to bigger egg production and bigger profit. Read the following letter from The White Arrow Farms, Cheraw, S. C., one of the most modern plants in the country—see what they think of Ful-O-Pep Feeds:

"We have just placed an order for another carload of Ful-O-Pep Feeds: As you know we feed nothing else and are more than pleased with results we are getting.

"This year we hatched out over 11,000 chicks and have had no diseases that could have been caused by poor feed—in fact, we have had none. Our Broilers raised on Ful-O-Pep bring two to three cents more on the market than the average, due to fatness.

"Our layers, as a whole, have continued laying even through the worst of the moult. We gladly recommend Ful-O-Pep to anyone who wants real quality in feeds."

You will be more than pleased too, with Ful-O-Pep Feeds—give them a trial.

Puyallup: Highest, White Leghorn, 1,306 eggs, average, 261; lowest, Buff Leghorn, 668 eggs, average, 134; lowest in the popular varieties, White Leghorns, 807 eggs; average, 161. Mountain Grove: Highest, Rhode Island Reds, 1,233 eggs; average, 246; lowest, White Leghorns, 586 eggs; average, 117. Fayetteville: Highest, White Leghorns, 1,140 eggs; average, 228; lowest, White Rocks, 596 eggs; average, 129. Storrs: Highest, Barred Rocks, 2,234 eggs; average, 223; lowest, Dark Cornish, 858 eggs; average, 86. Vineland: Highest, Rhode Island Reds, 4,302 eggs; average, 215.

"In these contests there were 2,215 White Leghorns, which produced an average of 168.4 eggs per hen; 360 Barred Rocks, averaging 163.7 eggs; 560 Rhode Island Reds averaging 162.3 eggs, and 600 White Wyandottes, averaging 150.8 eggs."

Turkeys Cross on Hens

Hybrids which have been called Turkhens, have been produced this year in California from a cross of a turkey gobbler and a Rhode Island Red hen. W. F. Coleman of San Diego first reported this cross to us. We are indebted to H. L. Musser of Los Angeles for the accompanying picture of two of the hybrids which he is raising.

The hybrids have some of the characteristics of the turkey, such as a long, bare neck, a head similar to a turkey's, and the same habits in going about and picking seeds and insects here and there over the range.

The usual wishful rather than actual things are being told about the hybrids, such as freedom of the ailments of both turkeys and chickens, remarkable egg production of the hen with the remarkable size and flavor of the turkey.

In point of fact, nobody has ever been able to blend into a single animal the qualities of two separate species. Sometimes species cross and produce hybrids or mules, as, for instance, this gobbler-hen case, or the case of a pheasant cock and hen, or an ass and mare. The offspring stop with the first cross, however, for the mules are incapable of reproduction.

The theory of evolution would inculcate the belief that one species descends from another, and that there is a gradual development from the lowest forms of life up through fish to fowls, to animals, to man. That proposition cannot be demonstrated by the breeder, for the different species are absolutely fixed and limited and do not cross with one another and produce fertile offspring. The breeder finds each species as a distinct and separate creation; and evolution becomes a speculative theory.

No one need anticipate that in the turkhen California has a new creation.

Geo. Hackett's Success

The National Dairy Show, under the management of Col. Skinner, did a big thing for purebred poultry by opening up a poultry

section under the direction of Geo. Hackett. The event was staged the second week of October at St. Paul. Chas. Pape, who attended the exhibition, reported "1850 birds of very good quality."

It is a fine thing for poultry when big interests like the purebred dairy breeders say, "Come in with us and be welcome." We have had enough of the rabbit and cavy men—let's get acquainted with real live stock showmen.

Another instance of recognition of the purebred hen is the silver cup being offered at the Illinois State Poultry Show this year by Len Small, Governor of Illinois. This is in line with the Harding, Coolidge, Wallace cups at the National show in the national capital.

More Than Was Bargained For

The committee on the Protection of the Poultry Industry, of the American Poultry Association, is deserving of and is receiving the warm congratulations of American poultry keepers for the effective work done in behalf of high protective duties against eggs and egg pulp from the low cost countries of Asia.

A careful reading of the new tariff bill, which is now law, discloses that the American Poultry Association got more than it bargained for. The new tariff provides that all live poultry having a value of \$5 or less shall be levied with a duty of 50 cents, and poultry valued at more than \$5 be assessed a duty of 20 per cent ad valorem.

The tariff bill provides the President of the U. S. with authority to raise or lower any rate in the bill not to exceed 50%, and he may apply the American valuation plan in assessing ad valorem duties.

The A. P. A. is an international breeders' organization of all North America. It is unfortunate that it should have sponsored a tariff which calls for a duty on purebred poultry, while fancy pigeons are admitted free. The committee, however, is really not to blame. Professor Rice and his associates were out to protect the commercial egg farmer, and they did a good and commendable job of it. It was the duty of the President of the A. P. A., as a member of that committee, to look out for the interests of poultry breeders. Information is that the President did not attend any of the committee conferences in Washington.

It is time that a good managing-secretary was appointed to attend to the business of the A. P. A.

A. P. A. Needs New Secretary

Last March Mrs. Campbell was married to Thos. F. Rigg, President of the American Poultry Association. Mr. Rigg is a man of independent means. It is probable that he will not want Mrs. Rigg to continue indefinitely in her present secretarial duties. Moreover, as a matter of business, this office should be filled by an energetic managing-secretary. It is not too soon for some good man to be considered in that connection.

As an example of the waste motion of the present system: There is to be a convention of the Southern Commercial Congress in Chicago, Nov. 20th to 22nd. That organization proposes to develop trade relations with Mexico. Thereupon, President Rigg calls 21 members of the A. P. A. from 21 different states to lay down their work and go to the personal expense of attending the convention of the Southern Commercial Congress. Probably no one of the twenty-one will attend.

Theo. Hewes Announces Platform

Theo. Hewes, Indiana, candidate for President of American Poultry Association, announces his platform as follows:

1. Suggest such changes in the constitution and by-laws as will give every member the same rights and privileges.
2. Make the American Poultry Association a real live stock organization that every poultry breeder in America will be glad to be a member of.
3. To abide strictly by the constitution and by-laws.
4. Make no expenditures without the con-

7 Varieties of Trapnested Layers

We have spent 32 years in putting the "lay" into our birds by trapnesting, pedigreeing and Hoganizing, and have succeeded in establishing strains of our different varieties with egg records from 180 to 256 eggs.

**White and Buff Leghorns
Barred and White Rocks
White Wyandottes
R. I. Reds**

All bred to Standard type and for high egg production.

SUNNYSIDE PULLETS

—the most profitable layers known

Are easy feeders, of good growth and have the ability and breeding to produce eggs during the winter months when prices are high.

The following prices should interest every reader:

5 Months Old

180-200 egg-bred	\$2.50
210-248 egg-bred	2.75
240-256 egg-bred	3.25

12 Weeks Old

180-200 egg-bred	\$1.75
210-248 egg-bred	2.00
240-256 egg-bred	2.25

COCKS

Same Records
\$5.00, \$10.00, \$15.00.

HENS

Same Records
\$2.25, \$2.75, \$3.25.

sent and advice of the Executive Board.

5. Ask for a new hearing on express rates and arrange to be in attendance when the committee on express rates is called and be in a position to present the fancier's side for their consideration no matter where this meeting may be held.

6. Make the membership of greater value by giving the association and its members such publicity as will keep them constantly in mind before the buying public.

7. Publish the proceedings of all conventions and see to it that every voting member has a copy of such proceedings.

8. Pay all bills promptly when presented and take the cash discount.

9. Have printed in the poultry press at least twice each year the Secretary's financial report so that every member may know just where we stand.

10. Take the Association out of the publishing and supply business and devote the time of the Secretary's office to the sale of Standards, the securing of new members, and in the right way helping every department in the management of their poultry affairs whether they are engaged in the fancy or commercial end of poultry breeding.

11. Cut out all needless expenses and create a sinking fund so that interest on deposits will take care of the overhead.

12. Make no trips at the expense of the Association unless ordered to do so by the Executive Board.

Mr. Hewes has been devoting his best efforts to the poultry industry for the past thirty-five years. His platform speaks for itself. Mr. Hewes was Secretary of the A. P. A. in 1896, and has kept in close touch with affairs for years. Poll of the vote of the Brocton, Mass., fair showed that Hewes and Drenstedt were the choice by 100%.

Prizes on Over-shown Birds

W. N. Watson, illustrious Buff Cochins breeder of Pennsylvania, writes on that old riddle of "I love the huckster, I love him not." Mr. Watson says: "I was at York Fair last week, where they had a high proportion of good stock, in fact, what they had in the main building was about 90 per cent in good shape and condition, but cooped in pairs. The hucksters were in tents outside and I only wish the "Society for Prevention of Cruelty to Animals" would take hold of such alleged exhibits like they do game cocks when they raid a fight. A number of those birds were unfit to show or live, yet they will all be at Hagerstown this week, except the ones that died en route. I suppose it would be altogether out of place for fairs and judges to throw out all unfit stock and not award prizes on them after the good hucksters have kept alive so many breeds that would not otherwise be seen. We owe these disease spreaders our everlasting debt of gratitude."

One Crisis After Another

A statement has been pretty generally circulated that the poultry business is "facing a crisis."

Nothing new about that. There is always some big problem for somebody to worry over. If there is no crisis, somebody invents one. We simply must have something "big" looming up on the horizon.

Fortunately for mankind, most of our troubles never happen. Perhaps the heralded "crisis" in the egg trade will not happen.

What we do not understand is why the prophets, who seem to have so much "advance information" about impending crises, do not move over on the mercantile exchange and make their fortune as traders.

Egg brokers who bought the spring flow of eggs are not making any money right now, for the reason that instead of letting more of the eggs go into consumptive channels last spring, they bid them up and stored them, not counting on railroad or coal strikes. With the men again employed, egg consumption is very good, and the heavy stocks are moving out of the refrigerator houses, but not as at high prices as the brokers would like.

Fresh egg prices show the usual seasonal increase. The demand for fresh eggs is good. The main thing the poultry keeper is think-

Win \$5,000

Sam Ross Did!

19 year old Samie Ross, Hackensack, N. J., who won \$5,000 in a former Reefer Contest.

\$10,000 Bank Guarantee

Producers and Consumers Bank
PHILADELPHIA, PA.

To the Public:

E. J. Reefer has deposited \$10,000 in this bank to be used in awarding all the prizes in the "C" letter contest.

This Bank guarantees that no part of this \$10,000 will be used for any purpose until all the prizes have been paid by E. J. Reefer.

Very truly yours,
PRODUCERS AND CONSUMERS BANK
by Benj. B. Bowman, Treasurer.

Mrs. Young Got \$5,000

Mrs. B. R. Young, of Girard, Pa., another winner of a \$5,000 Reefer Contest Prize.

LARGE PICTURE SENT ON REQUEST FREE

\$10,000 in Prizes!

	If no order is sent	If a \$1 order is sent	If a \$2 order is sent	If a \$5 order is sent
1st prizes	\$50	\$250	\$600	\$5000
2nd prizes	35	100	250	1250
3rd prizes	30	60	125	500
4th prizes	25	50	75	375
5th prizes	15	35	50	250
6th to 10th prizes, each	10	25	40	100

Every prize in every column will be awarded.
40 prizes in all, totaling \$10,000 will be paid.

OBSERVE THESE RULES:

- 1—Any one excepting our employees and their relatives may enter this contest. There is no entrance fee of any kind.
- 2—All word lists must be received through the mail by E. J. Reefer, 9th & Spruce Sts., Philadelphia, Pa. and envelopes must be postmarked by post office closing time, February 15, 1923.
- 3—Contestants who have sent lists or orders before February 15th will be qualified for the higher prizes provided orders are received through the mail, postmarked on or before February 28th.
- 4—Only English words will be counted. Obscure, hyphenated or compound words will not be counted. Only the singular or the plural of a word may be used, but both singular and plural will not count. Each article or object can be given only one name. Single words made up of two separate words or objects, such as teaspoon, teapot, or teatime will not count. Webster's International Dictionary will be the final authority. Where several synonyms are equally applicable to an object shown in the picture, a person submitting any one of such synonyms will be given credit for one word only.
- 5—The largest list of words which correctly name visible objects beginning with the letter "C" will receive first prize, and so on down the list of prizes. The winning list will be made up from among the words submitted by the contestants, and not controlled by any predetermined list of words selected by the judges as being the "correct" or "master" list.
- 6—For each wrong word a percentage

will be deducted from the total number of correct words.

7—Two or more people may co-operate in answering the puzzle. However, only one prize will be given to any one household or any one group.

8—You must use only one side of paper. You must number each page and object in a consecutive notation. Your full name and address must be written on each page in the upper right hand corner. An enlarged picture will be furnished free upon request.

9—The final decision will be made by three judges entirely independent of and having no connection whatever with the E. J. Reefer Company. They will judge the answers submitted and award the prizes at the end of the contest. Each participant entering this contest agrees to accept the decision of the judges as final and conclusive, without argument or question. All answers will receive full consideration, whether or not merchandise is purchased. At the close of the contest, when all lists have been graded, the lists winning first prize and correct list determined by the judges and the names of the prize winners will be published and a copy of such list and prize winners' names and addresses will be sent upon request to any participant who sends us a self-addressed, stamped envelope.

10—An additional prize of not over \$600 for promptness, as specified above, will be awarded.

11—In case of ties for any prize offered, each trying contestant will receive full amount of the prize so tied for.

How Many Objects in This Picture Can You Find Beginning with the Letter "C"

There is Cap, Cornet, Cane. How many more can you find? Write them down and send them in as soon as possible. See how easy it is. Everything is in plain sight. No need to turn the picture upside down. This is a game of skill. Effort and perseverance will win.

Costs Nothing to Try!

If you send in your list of "C" words and the judges decide your list is the largest which correctly names the visible objects beginning with "C", they will award you first prize in whatever column you qualify. If your list is second best list, they will award you one of the second prizes, etc. Get started right now!

Win the \$5000 Prize!

You do not have to buy anything to enter this contest and win a prize!

If the judges decide your list of "C" words is best and you have not ordered anything, you will win first prize of **\$50**

If you send in a \$1.00 order for either Washing Tablets or "More Eggs" Tonic, and your list is awarded first prize, you win **\$250**

If you send in a \$2.00 order for either product, and your list wins first prize, you get **\$600**

But if you send in a \$5 order for either product and you are awarded first prize, you get **\$5000**

(Study the Prize List)

Besides there are 36 other cash prizes. Every prize in every column will be awarded. 40 prizes in all, totaling \$10,000 will be paid. Second prize in column 4 is \$1,250. Third prize \$500, etc. Just think of it—40 chances for you to win.

\$600 Extra for Promptness

Your word list may be mailed any time up to Feb. 15, but for every day before Feb. 15 that your order is received, a special prize of \$10 for each day (not exceeding \$600) will be added if you win the \$5,000 prize. Send order today and word list later.

Win All You Can! Be sure to send your orders for \$5 worth of Washing Tablets or "More Eggs" Tonic if you wish to qualify your list of words for the \$5,000 first prize and the other prizes in the 4th column of the prize list. Don't delay sending in your order. Get the extra prize for promptness. Send your order today.

Goods You Get Either one of these products may be ordered to qualify in this contest, but combination orders will not be accepted.

"More Eggs"

A Wonderful Poultry Tonic

A scientific poultry tonic, used by half million poultry raisers with great success to increase egg production during Fall and Winter. A highly concentrated preparation. Makes rich, red blood. Helps the digestive apparatus. Sharpens the appetite and helps prepare for healthy egg production. Does not contain one particle of bran, or grit, or any filler. 100% concentrate. Contains every ingredient my vast experience tells me is needed to make a remarkable poultry tonic.

Two \$1.00 packages. Prepaid **\$1** Five \$1.00 packages. Prepaid **\$2** Economy size, or 20—\$1.00 packages. Prepaid **\$5**

Washing Tablets Take all the back-breaking work out of washtime. One tablet to a tub of water. Soak clothes and rinse. So simple and easy! Wash dirtiest clothes with only 15 minutes work.

Family size, prepaid **\$1** Economy size, prepaid **\$2** Jumbo size, same as 7 large \$1 packages. **\$5**

Start NOW!

FREE

Send in your order today. Think of the extra prize money for promptness! Qualify for the biggest prizes. \$50 or \$5000— which do you want?

Everyone, sending for a large size picture will receive, fully prepaid, a sample package of a world famous, exquisitely scented, high priced Complexion Powder. Send for it today.

ing about right now is how to get the egg. He isn't bothering his head about the storage situation which arises out of farm eggs that went into refrigeration last spring.

De Lancey's Platform

Frank W. DeLancey, Pennsylvania, candidate for President of American Poultry Association, announces his platform as follows:

1. I am for a representative form of government and for the adoption of a constitution at Philadelphia in 1923 that will bring this about in the broadest sense that the 'representative' can be applied. Less than one-tenth running the affairs of the National body with more than nine-tenths having no voice must and shall be abolished.
2. I am for the strongest and most able man that can be secured for Secretary of the American Poultry Association.
3. I am in favor of a permanent home for the American Poultry Association.
4. I am in favor of the members themselves transacting the real business of the Association at the annual convention, and this power should be taken out of the hands of the Executive Board.
5. I am in favor of using all the power and influence at the command of the American Poultry Association to secure a lower express rate on poultry, pigeons and pet stock shipped to poultry exhibitions and for breeding purposes.
6. I am in favor of restoring back to the members the privilege of selecting the place of annual meeting, and the selection of such committees as are now being elected by the Executive Board.
7. Abolish all needless expense and create a reserve fund. I am in favor of making no expenditures except those voted on by the members themselves in annual convention assembled, except those which may arise between the times of annual conventions, and then only when authorized by a majority vote of Executive Board.
8. I am in favor of closer work with poultry shows and associations in order that they be made more successful for themselves, exhibitors, concessioners and the public. Our shows are the recruiting stations of the entire industry. In the past shows could come and go, and go and come, and the American Poultry Association cared not.
9. I am in favor of making the Association something of value, an asset to every member. Redeem the old organization for the breeders themselves and organize from the bottom up instead of from the top down, and give all members' equal rights and full value for their membership.
10. I am in favor of the closest co-operation with the specialty clubs and a majority vote by them on all matters relating to their breed shall be considered final by the American Poultry Association.
11. I am in favor of such legislation as will do the most poultrymen the most good and give to every member equal rights and privileges and make it an organization that every man and woman engaged in poultry work, as well as allied industries, will derive a benefit by becoming a member.
12. I am in favor of having the Secretary publish monthly a correct statement of the affairs of the Association. The Association belongs to the members and this they are entitled to.
13. I am in favor of the President surrounding himself with an advisory board, consisting of the best men in the industry, working in connection with the Executive Board.
14. If elected, I will not be influenced by any clique, combine or individual, but will stand like a stone wall behind such a constitution as will be adopted by a majority vote.

Mr. DeLancey's platform represents the most progressive thought in the Association. He asks for the return of the conduct of affairs to the breeder-members themselves, the establishment of permanent business headquarters, and the selection of a competent managing-secretary.

We do not agree with section 10 of his platform, believing that the hobbies of specialists should never receive precedence over the judgment of well-balanced, all around men.

Correct Type and Color of RHODE ISLAND REDS

Remarkable Book Sent FREE

Rhode Island Reds The Best All Purpose Breed

If you already breed R.I. Reds, double your capacity. The demand for these great money-makers is bigger than ever. If you are not a "Red" breeder, act wisely and begin at once. Rhode Island Reds are the most beautiful, most popular, and most useful fowl on earth. They are sure winners anywhere; confined, or on range. They readily adapt themselves to all conditions, are hardy and easy to raise, have an exceptionally strong constitution—resist disease to a remarkable degree.

RHODE Island Reds will make you more money than any other poultry breed. They mature early, make a splendid market fowl, with sweet, juicy and fine flavored meat. Chicks reach broiler or frying size earlier than other well-known meat breeds. Reds are superior exhibition fowls. More Reds win at shows than other breeds. Hens make excellent mothers, yet not persistent setters. Ideal fowl for both farm or city lot.

Reds Lay More Winter Eggs Than Any Other Breed

Bred to Standard requirements, Red female is known to be among the world's greatest all-round layers. Her specialty is big brown eggs in cold winter months when prices are highest.

At all egg-laying contests, Rhode Island Reds, during fall and winter, have carried off more honors than any other breed. At 1920 National Egg Contest Reds won highest honors in both pen and hen classes. Highest pen over all breeds averaged 246.6 eggs per bird; Highest individual hen, 296 eggs in 365 days. R. I. Red pullet in Massachusetts laid 309 eggs in 365 consecutive days. Dr. Sanborn produced R. I. Red that laid 307 eggs in 365 days. Rhode Island Reds produce a lot of eggs when eggs are scarce and high. They are not surpassed by any breed when it comes to making profit for their owner.

Rhode Island Red Journal 3 Years For \$1.00 and "Blue Ribbon Reds" FREE

Everybody who raises or contemplates raising Reds should subscribe to the Rhode Island Red Journal at once. It's the only journal in the world devoted exclusively to Reds. It tells how to make big money with them. Tells you where to buy and sell, how to get greatest pleasure, most profit. Keeps you in touch with all leading Red breeders; tells everything you want to know about R. I. Reds. It is the "Red Breeders Bible." Those who know say they wouldn't be without it for \$5.00 a year. Published Monthly, 50c a year; 3 years \$1.00. Each issue contains 80 to 120 pages of intensely interesting and valuable information.

There is nothing in the world that will help you make more money with Reds than Rhode Island Red Journal and "Blue Ribbon Reds". This remarkable book is given absolutely free with a 3-year subscription to the Rhode Island Red Journal at \$1.00. Don't lay this advertisement aside; but sign the coupon right now. Pin a dollar bill to it. Mail at our risk today. Book and Journal will start at once.

RHODE ISLAND RED JOURNAL, 241 Democrat Bldg. Waverly, Ia.

"Blue Ribbon Reds"

Most remarkable book on R. I. Reds ever published. A book no breeder of Reds or anyone planning to raise Reds can afford to be without.

By means of the most remarkable set of Rhode Island Red Illustrations ever produced, W. H. Card, secretary of the Rhode Island Red Club, and the greatest living authority on REDS, in "BLUE RIBBON REDS," shows in a way so simple that every beginner can understand what constitutes the correct type and color of Rhode Island Reds. There are twelve drawings illustrating type and fourteen illustrating color. These drawings show the ideal Reds, both male and female, as well as the various shape and color defects most commonly found. Mr. Card also points out which defects are serious and which are of only minor importance.

Here are a few of the many subjects in

"Blue Ribbon Reds"

- An A-B-C Course in Judging Rhode Island Reds (in five lessons)
- How Rhode Island Reds Originated
- Mating Rhode Island Reds for Color and Shape
- How to Obtain Fast Growth and Large Size in Rhode Island Reds
- How to Breed up an Egg Laying Strain
- How to Cull Rhode Island Reds
- How to Prepare Rhode Island Reds for the Show Room
- Which is the Correct Rhode Island Red Color
- Disqualifications
- Feeding Poultry at All Ages
- How to Treat Sick Fowls
- How to Get Rid of Lice and Mites
- How to Build Poultry Houses and Equipment.
- Standard Weights
- Linebreeding

Special Illustrated Features

A picture of Rhode Island Reds in natural colors, suitable for framing, the latest and best ever published, copyrighted 1919. Pictures of many prize winning Reds at National Shows — Description of a common sense window for fresh air poultry houses and detailed illustrations made from blue prints. How to build a practical poultry house for a small flock of chickens — How to make a good home-made trapnest.

"Blue Ribbon Reds" is a veritable encyclopedia of useful poultry information. Cost \$3,000 to produce. You must see a copy of this book to appreciate its value. Given free with 3-year subscription to the Rhode Island Red Journal.

ALL ABOUT LEGHORNS

Remarkable Book FREE

**Remarkable New Book,
just off the press "All About
Leghorns" Sent Free to every-
one who mails coupon below.**

Everybody who owns Leghorns should send for this remarkable new book at once. It contains the latest and best information ever published on the World's Greatest Layers. It will help you more than anything else to become successful and make more money with Leghorns.

21 Subjects Thoroughly Discussed

How to mate and breed Leghorns. How to judge Leghorns. How to condition Leghorns for the show. How to wash White Leghorns. What and How to feed Leghorns. How to prepare a balanced ration for Leghorns. How to produce a strain of heavy layers. How to increase egg production through the use of artificial light. How to obtain highest prices for Leghorn eggs. How to care for baby chicks. How to feed Leghorns at all ages. How to obtain best results under farm conditions. How to mate Buff Leghorns for color. How to select the high egg producers. How to build a modern egg farm. How to properly rear Leghorn chicks. How to build a winter egg strain. How, when and where to advertise. What to consider in mating Brown Leghorns. How to select the males that produce high egg record females.

This last subject is of special importance to every breeder. It is not sufficient to have only a few high producing females. It's a whole flock of them that makes you money. Since the male bird is half the flock, it's the science of selecting males which will produce high egg record females that makes you successful. This subject tells how.

Special Subjects on Poultry Diseases

Special subjects on How to Prevent and Cure Bumble Foot—How to Combat Lice and Mites—How to Treat Diseases of Leghorns—How to Prevent and Treat Poultry Diseases through Vaccination. This information alone is worth more than \$10 to anyone.

Send for This Great Book Today

You must see a copy of this wonderful book to appreciate its value. It is a real encyclopedia on Leghorns. The book is not sold. But we want to invest in new friends; and will give you the book absolutely free if you mail the coupon with \$1.00 for a three year subscription to

The Leghorn World

Official organ of all Leghorn specialty clubs and only publication in world devoted exclusively to all varieties of Leghorns. Published monthly, 50c year, 3 years, \$1.00. Twenty-Six Years with Barred Plymouth Rocks

(Continued from page 1001)

saddle; brown or with frosted edging on wing and tail coverts; weak in breast color; merged and coarse in wing and tail barring, with main sickle feathers often a weak ashy color in the best specimens.

The under color was of a cottony hue. Later as progress was made ashy or smutty toned under color began to be a prospect. The darker colored specimens were the winners, as they only carried what was then called "under color," which meant smoky blue or gray, with very shallow, if any, under barring.

This under color in time became pretty well established in the dark males, especially after the use of the very dark, almost black, female became general. As there was a tendency in the males to run light in surface color as well as light in under plumage, the dark females became a very valuable reservoir of dark pigment for the improvement of the males of the variety.

While this dark, smutty female served her purpose well for a time, progress revealed that she was no fixed requirement of the variety, and progressive, constructive breeders began to select her more attractive sisters as the most valuable for improvement of her sons and daughters. Had the A. P. A. made a standard for that truly dark B. P. Rock female and considered her perfection because the experience of those years seemed to prove her such, we would not have the beautiful, attractive cockerel-breeding female of today that promises still greater beauty in the future.

The females of the variety varied greatly a quarter of a century back. The lighter, cleaner colored specimens were the winners. Merged color due to the light and dark bar running together, rather than clearly cutting off sharply and forming clean cut, distinct bars, was troublesome. Brown and smut were plentiful in all sections. To remedy these defects experienced breeders selected very light, almost barless males. They were truly light in color, so much so that visitors to our yard almost invariably inquired as to what breed of chickens they belonged. When informed they were B. P. Rocks, would exclaim: "Oh, those are the culls!" I see quite a different exclamation now after years of improvement. Now it is, "Oh, what a beautiful, clean-colored cockerel that is! Barred to a queen's taste!"

The A. P. A. was wise not to make a standard for that light, barless fellow twenty years back, although nature seemed to point that way at the time. It would have been a crime to have set him up as ideal and stop further progress of the variety. He was valuable at the time as breeding material. He helped along the progress of the variety in producing a good clean, light bar for future work and progress.

Today things are different. There is no longer need for light, washy barless males, nor is there need for females so dark and smutty that they are almost barless. We still need a few males relatively light, as color correctives, and a few females quite dark as color reserves. Correctly mated, they help along to new values in the great work still to be accomplished.

A Study of Barring

Here we found the field wide with much work to be done. The pattern of barring in the different sections showed as great variation as we found in shape and color. The barring at the base of the neck hackle was usually coarse and broken; the breast barring open and much crescentic in shape. As a rule these breast feathers ended with a light tip rather than with a dark bar. The barring on the shoulders was zig-zag and merged in color. The wings and tails were splashy and weak in barring at base. There was a great deal of V-shaped barring in neck and back. Bars were coarse in all sections and bars of different widths would be found on the same feathering. Now under barring made its appearance and created such interest that certain breeders and judges made their decisions of quality, worth and beauty on a few bars near the skin on back and saddle of the chicken. The next fad was a twin companion of under barring, and through poorly balanced breeders and freak judging the variety suffered its first injury in utility worth and reputation as a result of narrow barring. Prizes were placed on hide-bound chick plumage because it was extremely narrow in barring and barred to the skin in back and saddle. This was painful to earnest breeders with the welfare of the variety at heart, but happily, like all fads, time has made the freak depart and in its stead we have the good Barred Rock

The Successful 300 Unit Hatcher Lower Cost Per Egg Capacity

"You may enter our order for 20 more of the 300 Unit Successfals with your new turning and cooling device included—some of our machines hatched as high as 95%."

"we enjoyed a very profitable season with our equipment of Successful 300 Unit incubators this season."

"..turned 900 eggs in two minutes."

"..among seven different makes of incubators I used last year the Successful proved to give the best results."

"..your equipment cost me only 85c per unit per hatch for gas and labor."

THESE letters from customers show what 30 years' experience has taught. The "Successful" 300 Unit Hatcher gets surer results, is more economical and practical and has a lower installing cost per egg unit than the so-called mammoth incubators.

Think of it. Your installing cost on the "Successful" 300 Egg Unit Hatcher will run from 1-4 to 1-3 less than for the "big-capacity" sizes. Any poultry man who has tried both will tell you this. The Successful 300 Unit Hatcher gets the best results and biggest hatches. Rudolph Berning in Hoagland, Indiana, got 180 chicks from 188 eggs. He has enlarged his capacity double. All his machines are "SUCCESSFUL" 300 Unit Hatchers.

Less Floor Space Simpler to Handle

Poultry raisers like "SUCCESSFULS" because they take up less room. This triple deck arrangement shown in the picture has a 900 egg capacity but it only takes up 12½ feet of floor-space. You can start with one SUCCESSFUL unit and add sections as you need them. Install them yourself—in 20 minutes. No factory experts—no expensive operators—no night watchman needed. Each unit can be operated independently of any other in the series. Patented devices have reduced labor of turning and cooling eggs to positive minimum. Heated with gas or "SUCCESSFUL" LAMP at small expense either way.

Banked \$5,000 First Year and Paid for Machine

One of our customers installed enough "SUCCESSFUL" hatchers for 45,000 egg capacity. He paid for his machines and put \$5,000 in the bank from his first years profits. Increase your hatching capacities and make swift, sure profits. Hatch big, strong, healthy, fluffy chicks—the kind that command the best price or grow best to an early maturity.

**Operate Each
Section
Independently**

Exclusive Points of Merit

- (1) Heats the colder edges of the body first.
- (2) Round corners on tank. No leak, break or loss. Faster current with even heat and better regulation.
- (3) Scientifically ventilated. Admits cold air at center of top. Does not create draft which dries out eggs.
- (4) Safety attachment on lamp—absolute fire protection.
- (5) 12-ounce copper tank.
- (6) TWO glass doors.
- (7) Combination water thermostat regulator.
- (8) Built like a refrigerator—non-warpable case—weighs more, costs less per pound—cabinet made with all corners and joints mitered together, holding all the heat and offsetting outside temperature changes.
- (9) Stronger egg trays.
- (10) Nursery under the egg trays.
- (11) Detachable legs, easily moved and handled.
- (12) Adjustable stationary thermometer.
- (13) A real Guarantee with no loop-holes.

103-Degree Incubator Co.
Crown Point, Ind. Box 151

Why the Famous
103-DEGREE
Incubator
is Years Ahead
of All Others

World's Greatest Incubator Discovery

of 1922. It possesses clear, clean cut, straight across the feather barring; an equal division of light and dark bars, reasonably narrow and uniform in pattern in all sections, the bars placed on a well-balanced symmetrical body. Such quality now starts the grand old breed on its third quarter century of development, with promise of the most beautiful and useful chicken the world has ever known.

As I lift the curtain of the future, I see our exhibition or Standard male as a clean, soft, rich, uniform colored bird with clean-cut, straight across the feather barring, equal in the division of the two bars, and uniform pattern over the specimen as a whole. And the Standard exhibition female. No, she will not pass away. There may be bigger classes in the shows of cockerel-bred females. But remember there are both brains and breeding value back of every really good Standard exhibition female you see. And now of the Standard female of the future: A richer color attained though a cleaner light bar and a dark bar carrying a velvet hue; a clean-cut division of straight across the feather barring in all sections; good width of feather.

Of the cockerel breeding female, cleaner, brighter, strong in color, nearing the future improved exhibition female; straight across the feather barring.

Pullet breeding male: Surface barring; also wing and tail, equal division, very bright, clean cut and straight across the feather in all sections. Light bar, very clean and conspicuous in under barring. All free from the long narrow feather found in many specimens at present time; and these pullet breeders will be possessed of well formed, symmetrical bodies of true Plymouth Rock shape.

What makes the Barred Plymouth Rock the everlasting favorite? That is due to all the different color sections being separate problems that require individual study. Then this quality must be assembled in a uniform whole. All that is required to produce the outstanding specimen.

Along with the great vigor and utility merit of the breed and the chance of new variations of beauty likely to appear any year to the trained eye of the well-balanced, alert breeder, the breeding and mating of the Barred Rock is a study that never grows old, but, on the contrary, grows more fascinating as the years go by. Especially is this true in the experience of the fanciers, for a fancier-breeder is always a "learner," a student of beauty and worth. When he quits learning and quits trying, improvement stops. The new breeder should appreciate this fact. He also can learn and try. He should prepare now and get ready to succeed as older breeders some day. He will find every good Barred Rock fancier ready to help him.

Old Breeds That Are Being Overlooked

(Continued from page 996)

inveterate layer, and the more recent Minorcas and not unlikely Anconas and Leghorns owe something to their blood. In view of these facts can there be a more absurd supposition than that the new breeds, because they are new, excel the old ones as egg-producers?

Suppose the Old Breeds Run Out

Some are influenced by the notion that while the older breeds were good in their day, they have "run out." It is probable that potatoes, wheat and other seeds, which supply the analogy, run out, not because the variety itself deteriorates, but because the soils in which they are grown become deficient in the foods those particular varieties need. Plainly, this is a wrong idea when applied to races of live stock. In good hands the old races of fowl improve in feather, size, vigor and production. In poor hands, neglected and poorly bred, the best of the recent breeds will assuredly run down in all these qualities.

Beginners are sometimes prejudiced against varieties of poultry having the more elaborate parti-colored feather-pattern, whether old or new, simply because of their attractive appearance. They have been told that such are show birds pure and simple. It is said that their owners in the effort to get the feather have inbred them to such an extent that they are good for nothing but to look at. How often are the owners of these birds asked in a tone of suspicion, "Do they lay, or are they just for looks?" that is impossible to avoid suspicion of a deliberate propaganda. Now it is perfectly fair for the utility man to say everything truthful in praise of his own stock. He can even be forgiven a little exaggeration on that line.

Feed your chickens sprouted grain winter and summer to get more eggs. Green sprouts contain exactly the food solids necessary for egg production. Successful poultry raisers everywhere say sprouted grain is the best natural egg-producing feed ever used. The cheapest feed ever known. One bu. of grain makes 3 bu. of green feed when sprouted in a

BUCKEYE
COLONY BROODERS

But it is no legitimate part of the game for him to knock the other man's birds with statements which are more than 90 per cent false.

Cases are known of fanciers who sacrificed everything for feathers, but in the nature of the case, that practice cannot be long continued. The man who does it puts himself out of business. Fancier-breeders know that they must maintain constitutional vigor and are doing it. Those who propagate the contrary idea do the fanciers a great injustice. Of all others the scientific breeder best knows the indications of strength and serviceability. The unskilled poultry keeper has the idea that the whole secret of vitality is new blood. To obtain this he frequently uses cockerels from another flock inferior to those of his own raising that he is eating or sending to market. The simple expedient of swapping or buying cheap cockerels is no insurance against deterioration. It sometimes hastens it.

More important is the question of choosing a breed when it applies to the more able and enthusiastic of our young poultrymen, men possessing the fancier's instincts and having the qualities that mark them as future leaders in this fascinating pursuit. Why are some of these men adopting the popular varieties to the neglect of the grand old breeds and often contrary to their own true inclinations? These are the key men. If the older fanciers can enlist their energies for the neglected breeds, they will do real service for the future of poultry culture.

Even these men cannot help feeling the influence of the prevailing fashion. There is always a tendency to go with the majority even when it is not impossible to pull the majority one's own way. It is the business argument, however, that has the most weight. "You can't sell stock in breeds that nobody is taking up. To make money you must have the breeds that others want," is the way it runs. That is like saying: "It is difficult for the beginner, even if he is at great pains and expense to secure the real thing, to get good prices for his stock in the popular breeds. In all those lines the big reputations are already established. Persistent advertising keeps them before the public. People prefer to deal with them and are willing to pay them better prices than the beginner can hope to command for equally good stock." The fact is, in the little known breeds the beginner has a good chance to sell because of small competition; in the popular breeds he has competition, but he has the advantage of popular demand.

This is our word to the enterprising young fancier. The leading men in the best known and most widely raised varieties are reaping their reward for persistent work and good breeding through an immense outlay in advertising. But take a leaf out of their book. What printer's ink has done for them and their birds it can do for you with other and equally good birds. Take up one of the less known and at present "unfashionable" varieties. Work for the highest quality in both useful and beautiful characteristics. Then advertise it in such a way as to make your name and that variety permanently identified in the public mind. This will do good both to you and the breed. It will also help the poultry interest in general by bringing a worthy variety to the public notice. Some of the best things in the poultry world are only waiting to be placed before the public; awaiting the enterprise and the man. Be that man.

Wonderful Achievements of Poultry Breeders

(Continued from page 998)

type and color as the work progressed.

The Sun Sets for Some Breeds

The permanent position of popularity which the Plymouth Rocks assumed and have continued to hold is accentuated by contrast with the fate of the various breeds in vogue at the time of their introduction. The Black Java had a considerable following and quite a few breeders cultivated its white variety with blue shanks. A fact which reminds me that a white Hamburg was then bred; these being shown variously with blue and white shanks; and the Standard for these was changed repeatedly to conform with opposed factions of breeders. I. K. Felch was an authority for the statement that the blood of these Hamburgs entered into the makeup of the Rose Comb White Leghorns. An instance of which I can attest the truth was the use of a Black Hamburg cock which apparently had been crossed upon with black games, which being bred to Single Comb White Leghorns produced a strain of rose-combs sufficiently good to win a sweepstakes cup for highest scoring pen at an important show in New England.

World's Foremost Poultry Feeding Secrets

Greatest Book on Feeds and Feeding Ever Published

If you need more money, if you want to make your hens lay more eggs this winter than ever before; if you want to learn about the most successful feeding methods for poultry of all ages, ascertained after years of experimenting on the part of our best breeders and poultry experts; the best feeding formulas used by the leading agricultural colleges in America; a formula for a standard egg producer that will turn any kind of hens, old, young, mongrels or purebreds into veritable egg machines; and a great mass of other valuable information on feeds and feeding—then you must have a copy of the "World's Foremost Poultry Feeding Secrets."

The one chapter giving a recipe for the Standard Egg Producer is alone worth many times a dollar, what the book sold for last season.

50 Scrub Gulls Produce 35 Eggs Per Day

To ascertain the effectiveness of the Standard Egg Producer the Standard Poultry Company of San Antonio, Texas, purchased fifty very low class mongrels, ages 2 to 4 years. The hens looked as though egg production were an impossibility with them.

"When we began feeding Standard Egg Producer," reports the Standard Poultry Co., "they were not laying—not even one egg a day. In eighteen days after feeding them the Egg Producer they began laying, and at the end of six weeks, their daily average was 35 eggs. They held this high average until we sold them, several months later. We have tested the egg producer with purebreds and with mongrels and in every case it produced a surprising increase in egg production." Illustration shows actual results before and after feeding Standard Egg Producer.

Standard Egg Producer Makes Any Class of Hens Lay in Any Season

The Standard Egg Producer is a respecter of no class of hens or seasons of the year. It will make scrubs lay in the winter just the same as purebreds in the spring. If used in connection with artificial light, the high egg yield would almost stagger the most skeptical.

Western Poultry Journal

Published monthly, 50c year; 3 years, \$1.00. The magazine is so good that every reader of this paper will want it. Contains exact information the practical every day poultry raiser and beginner is hungry for but which is so often sadly lacking. Practical and scientific poultry experts guide you through every step in poultry raising from egg to show-room or market. The book and magazine should help you make a wonderful success. Don't lay this advertisement aside; but take out your dollar bill right now, pin it to the coupon, sign, and mail at our risk and get the Western Poultry Journal every month for three years and the book free.

Make Layers out of Loafers

TO make hens lay in winter you must feed *growing* green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

This home-made Oat Sprouter was made in one evening by a 14 year old boy with no tools but saw and hammer. The total cost including the heater was \$2.49. Thousands of these sprouters have been made at home by poultry keepers, and hundreds of testimonials prove that it is the cheapest to make, easiest to operate, and handiest and best oat sprouter ever built. It will supply better and sweeter sprouted oats with less fuss and dirt and work than any sprouter made, no matter how expensive. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the Stove is \$2.00. Plans for building the sprouter are packed in every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

Don't go through another winter without an oat sprouter. You can't afford to be without one even though you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before spring. Most dealers keep them. If yours does not, send me his name and \$2.00 and I will send you the stove postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in 10 days and I will refund your \$2.00 together with the postage for its return. I'll run all the risk.

Plans for building this Oat Sprouter, sent free on request.

Little Putnam Stove keeps water unfrozen—not hot

The Jersey Blue was a breed similar to Rocks in build which I saw exhibited at the Madison Square Garden show in February, 1885. How history repeats itself is shown in the recent admission of the Blue Plymouth Rock.

The breeds of fowls which have been snuffed out of existence about as soon as they appear remind me of an epitaph which was put upon the tombstone of a child. "I was so quickly done for, I wonder what I was begun for." Soon after the introduction of the Indian Games, as the Dark Cornish were formerly known, a black variety named "Yucatans" made their appearance, which suggested a Cornish-Java origin. A short time ago inquiry was made concerning Sherwoods, for which no reply was forthcoming. This breed had quite an extensive popularity for a good many years; was said to have originated in a cross of White Georgia games upon Light Brahma. The Sherwood was a pure white fowl with lightly-feathered shanks and proved so useful a type as to have been advertised for some years by Burpee, the Philadelphia seedsman, as his poultry specialty.

The White Wonders gained quite a large following some 25 years ago. These were apparently a cross of White Wyandotte and Light Brahma. A petition to the A. P. A. for Standard recognition which was stated in the poultry press at that time to have borne the longest list of signers of any breed ever submitted; was turned down as wanting a distinctive type. They soon dropped out of sight. It may have been a mere coincidence, but the white varieties of Rocks and Wyandottes soon after this took on a new accession of magnitude.

The Redcaps and Houdans cut quite a figure among the popular breeds at the period when I was first developing an interest in poultry. The fact that these and the several others I have named stepped down and out or into the rare breed class is no argument against their utilitarian and fancy worth, but illustrates the tendency for one fashion to follow another. At the same time we must admit that the question of utility has been a potent force in fixing the permanent status of breeds. Our Rocks, Wyandottes and Reds first won popular approval by their practical traits.

That Famous Book, "The Hen Fever"

I presume that my personal experience is identical with that of most fanciers in that seemingly trivial incidents first led to the growth of the poultry idea. A clergyman was settled in the home town who possessed, or was possessed by, the "hen fever," as it was commonly termed—perhaps derived from George P. Burnham's book bearing that title—a travesty upon the profession and a work which was appreciatively read by the general public despite its low status considered as literature, its boastful tone and a moral purpose which sought to present the poultry fancier in a ridiculous light. Well, this pastor preached the gospel of improved hens so successfully that a poultry show was held at which he carried away about all the honors; and, incidentally, the Poultry World of Hartford, Conn., was made a visitor to many homes. When I finally left town pursuits in favor of market gardening and poultry keeping, at first as a strictly practical venture, I found several volumes of this pioneer paper and under its guidance "the weed straightway became a flower."

I presume that the influence of literature in the shaping of breeds and the poultry idea in general is but scantily recognized. The old Poultry World and the American Poultry Yard, the latter a weekly issued from the same office, soon taught me that poultry not merely as food producers, but by their appeal to human intelligence and artistic skill, was a worthy object of pursuit. These papers were well illustrated with stock cuts of the various breeds then in vogue, mostly from the pen of I. Porter, and these were sufficiently good to appeal to the fancier of that period. A characteristic feature was the regular appearance of some prominent breeders as the subject of biographical sketch accompanying a wood cut. And in this way the faces of I. K. Felch, Philander Williams, Henry S. Ball, J. Y. Bicknell, George P. Burnham and many others became familiar to the public.

The general trend of the reading matter was distinct from that of today. Controversy was rife, and two absorbing topics had a voluminous airing, namely: telegony, or the presumed influence of former mating of a hen upon the progeny of a later mating; and discussions upon the rating of a specimen by the score card system of judging, at different shows and by different judges. Indeed, the show room of that time was a lively place, and nothing short of the introduction of comparison judging could have

Winter Eggs

OVER eighty per cent of an egg is water. To get lots of eggs in winter you must keep unfrozen water constantly before your hens. One cold day, with water frozen, may stop egg production for a month. A Little Putnam Stove keeps the water at just that tonic temperature best relished by the hens. The increased egg production from a pen of eight fowls will pay for the stove in one month. Don't "monkey" with frozen fountains this winter.

The Little Putnam Stove is protected by basic patents. There is nothing like it in the world. It is made of galvanized iron and brass; is 9" in diameter; 4" high; holds 3 pints of oil, and *burns a month without filling or trimming*; consumes only one tablespoonful of oil in eight hours; fool-proof and fire-safe; *keeps water from freezing in zero weather*; used under any can, crock or fountain; also used to heat a Putnam Home-made Oat Sprouter. Plans for building Sprouter go with every Stove.

Get a Little Putnam Stove from your dealer now. Price \$2.00. Most dealers keep it. If yours does not, send me your dealer's name and \$2.00 and I will send you a stove postpaid. If, after use, you do not find it all I claim, or are not perfectly satisfied, send it back in 10 days and I will refund your \$2.00 plus the postage for its return. You can't afford not to try this wonderful invention. You do not risk a cent.

Write today for instructions how to build Oat Sprouter or Brooder—they're free.

Little Putnam Stove keeps water unfrozen—not hot

served to bring about the comparative order that now rules in the show room.

As the representative of a poultry paper, I covered the eastern circuit for a number of seasons, and it was in this capacity that I visited Fall River, Mass., and first saw Rhode Island Reds, several local breeders showing both comb types. I do not recall the date further than that it was the year preceding the one which saw a big collection at Boston. However, the project of writing a standard description for the Reds was up at a meeting of the breeders which I attended for the sake of reporting. Their deliberations had gone no further than debate upon the question of combs, both rose and single being favored by the breeders. An outsider like myself, a representative of some food product, or other, seemed determined to monopolize the business by presenting the plan of admitting the pea-comb Red, specimens of which were not staple, but had occasionally appeared, a scheme which found no favor among the breeders assembled. After quietly listening to the discussions for awhile, I became a member of the club and proceeded to controvert the outside influence, urging the breeders to retain management of their affairs in their own hands.

After the lunch hour the newly-formed club again sat, and a color description which I had been requested to draw up was voted upon. The name Rhode Island Red was formally adopted, and the color description sanctioned yearling hens with a color faded from the effect of laying. The aim was not to adopt an idealized color type, but to describe the stock as it then existed. My recommendation as to color was not followed in one particular: to the effect that the exterior of plumage be red throughout, the black essential to hold the red to be confined to under color. A fancy type which continues permanently popular never stops advancing its ideal, and the proposition is a fair one that some future time will see a consistently red fowl. I have thought of this in connection with the Buckeye, and for some years F. D. Baerman of New Jersey worked to produce an all red American Red.

The question of the permanence of breed types, or the successive changes breeds are destined to undergo in their development, is to the progressive breeders a most interesting and important study. Why certain breeds gain a footing while others do not, or what are the determining factors contributing to a breed's success it would be difficult to estimate. There would seem to be much in luck and chance, and to this I attribute the gradual disappearance of the Buckeye, which doubtless would today be a strong candidate for most popular breed but for the prior appearance of the Rhode Island Red. With a few years' experience upon which to base an estimate, I place the Buckeye first among breeds as one adapted to fill the joint role of meat and egg producer combined with a physical type which follows nature's specifications of vigor and charm of "presence."

Will this breed ever "come back" is a question which suggests how certain breeds have practically disappeared for a generation to become again popular. Mr. Loring of Massachusetts nursed his Buttercups through a lengthy period of apathy upon the part of the public until they finally won a second interest. The Campine, as I have recorded, is now among us as a reincarnation of a former existence. And the Russian Orloff would seem to be identical, save in color, with the "Black Russian" which I bred for a short time in the early '80's.

The commercial side of the poultry business has developed tremendously, but when I think of the charming personalities of some of the old-time fanciers, the impersonal devotion they displayed in furthering the general interest to the disregard of their individual gain, I am led to think that the term "fancier" will never again be better exemplified. My old neighbors, Philander Williams and Henry S. Ball, represented an "old school" type which will never be improved upon. So much for the past, and what of the future of our vast and growing poultry industry?

I consistently believe that the prospective developments in store for the poultryman of a generation or two ahead are beyond imagining. I believe that the cultivation of fine exterior beauty in fowls is destined to become the leading phase of art endeavor. That the public exhibitions and the spirit of emulation they instill will continue the gradual advancement in values of fine stock until the successful breeder will find his market waiting. Registration and score-card records of stock have long since had their day and been found wanting. But the registration afforded by photographs of individual specimens, that is, the coming phase of expression of qual-

5-in-1 Feeders

Pay for Themselves in Four Months

KEEP a constant supply of egg-making materials—egg mash, meat scrap, charcoal, grit, oyster shell—before your hens **ALL THE TIME** if you want winter eggs!

Self-feed with a Jamesway 5-in-1 Feeder, which supplies everything a hen needs, without waste. The egg mash saved in the overflow pans will pay for your feeder in less than four months' time.

Or, as George E. Good, of Waveland, Indiana, says: "If you are wintering only 40 hens, add 10 more and they won't cost you a cent for feed. You can keep them on the feed saved by the feed saver pans."

Everybody knows Knapp's Hatchery of Shelby, Ohio. Here is what Mr. Knapp says: "Your Jamesway dry mash feeders have been in use constantly for the past year and as a result I believe that there has not been one ounce of feed wasted. The best thing of its kind I have ever seen."

Jamesway Poultry Equipment

is practical, durable equipment, built for the poultry raiser who is trying to decrease his costs and increase his profits. It saves time, saves work, saves feed, and helps wonderfully in getting more winter eggs.

Jamesway 5-in-1 Feeders are solidly built of heavy, best quality, Keystone copper-bearing, rust-resisting, galvanized steel sheets. Set up off the floor. Tilting tops prevent roosting. Feed charcoal, grit, oyster shell, egg mash. Two sizes. Large size self-feeds 150 hens one week without re-filling. Small size feeds 75 birds. Egg Makers—Feed Savers—Labor Savers—Time Savers—Profit Makers!

Quality made, by the largest manufacturers of labor-saving barn equipment in the world, for practical poultry raisers.

Ventilate The Jamesway

Is your house wet? Is it cold? Do you have to freeze your house dry? Is cold and excessive moisture limiting the production of your hens, subjecting them to colds, roup, and other ailments?

Would you like to know how to put four walls around your house instead of only three? Would you like to know how to get a good circulation of clean air without harmful drafts?

Then ask us to reserve for you a copy of our new book on Poultry House Ventilation, which will soon be off the press. Ask for book No. 42. Free—no obligation. Address—

A MONEY MAKER FOR POULTRYMEN

The "EVERGREEN" Oat Sprouter

—the sprouter that's different

Satisfied Users Everywhere

Cuts Your Feed Costs

At Last!
The Perfect
Oat Sprouter

B. J. Baskerville
Joliet, Ill.
Am writing to tell you how much I like my "Evergreen" Oats Sprouter. I find that the "Evergreen" is a good investment for poultrymen. It will grow a continuous supply of green food. It will grow from three to four inches in a week (the time allowed each pan by feeding one a day). It requires but very little attention. I am satisfied in saying that you manufacture the best oats sprouter on the market.

Yours very truly, (Signed) FREEMAN HOFFMAN

Route 1, Columbia City, Indiana

After many years experimenting to produce an oat sprouter that would produce the greatest amount of tender green oat sprouts in the shortest time with less trouble and without any waste or spoilage, we have at last succeeded. This new improved EVERGREEN OAT SPROUTER is in a class by itself. Whether you are a "back-lotter" with only a few birds or if you are raising poultry on a large scale you need an EVERGREEN OAT SPROUTER—it spells SUCCESS to every poultry raiser—it cuts down feed costs—it

Converts One Bu. Oats Into More Than 3 Bu. Green Feed

The secret of the success of the EVERGREEN is in its two heat chambers—its interior arrangement—its heating system and its convenience. We discovered that different degrees of heat were necessary during varying stages of germination and growth of oat sprouts to get best results—the EVERGREEN supplies the different temperatures during the various stages—that's why it produces more green feed with less grain and spoilage.

EVERGREEN machines supply you with a never ending supply of an abundance of tender green sprouts, enough for your flock of hens every day. Each day put in a tray of raw oats, at top of machine and take out tray of tender sprouts at bottom—it's a revelation.

FREE Catalog Write today for descriptive catalog folder and price list, telling all about this Folder wonderful machine—how it will enable you to double and treble your poultry profits. Don't buy an oat sprouter of any description until you find out about the better, more convenient EVERGREEN.

ity; and hence the camera and coop are to become chief in the equipment of the fanciers' plant.

As to literature, the poultry book, and, in the largest degree, the poultry magazine, are to be in the future, as in the past, the leading promulgators of the poultry interest. And the fancier who makes the wisest use of this medium intellectually as to its reading columns, and commercially as to its facilities for extending knowledge of his business to the outside world (again in the future as in the past) will win success in the largest degree.

Practical Poultry Hints for the Month

(Continued from page 999)

yellow skinned and tender, and is ready to give the top price for it.

Hens appreciate punctuality in feeding. Remember this in planning your winter schedule of breeding. We like to see them come running at meal time as if they meant business. Fowls are not thrifty when they act as if they did not care whether school keeps or not.

If you are buying pullets this fall take any you can get provided the price is right for the size and age you get. Whatever you buy avoid runts and too small birds for their age and unhealthy specimens. They may lay eggs but they will be few and small in size.

In our eagerness to get pullets to laying we are quite apt to overdo the matter, feeding too much condiment and thus defeat our object. It is a bad plan to use condiments and drugs to force egg production. Some feed pepper liberally. A little pepper may be beneficial in aiding digestion, but much is detrimental. It adds to the expense of keeping the fowls and does not add to their egg production. Drugs and stimulants do more harm than good.

The common diseases of hens are never more seen than in November. That is the time for roup, catarrh, canker and bronchitis. The first cool month seems to favor disease more than the severe days that come later in December and January. Many of the diseases can be avoided with plenty of ventilation, clean litter and sweet, wholesome grains. Every poultry raiser should have a few good books relating to diseases of poultry. In buying such books make sure that they give much space to methods of preventing illness. We have nothing to say as to drugs and curing sick birds, but we want to impress you now with the thought that prevention is a lot more satisfactory than curing diseases. Your book that will tell you the causes and prevention of illness and you will be working in the light in your care and feeding of your fowls.

Now that the nights are cold it does not do the young stock any good to be roosting outside. Clean out your houses well, give them a very thorough cleaning, disinfecting the who's place with a good spray or white-wash. Then see to it that they go in nights. The cold, frosty nights are now ideal for giving them colds and colds soon spread rapidly when the birds are shut up, so take a little time now and avoid having your egg production go down when eggs are at a premium.

Remember that milk can always be used to good advantage in the poultry yard, especially now. Give the young birds all they want and watch them develop and produce. If you haven't skim milk give them buttermilk. Buttermilk can now be had in semi-solid or powdered form, and this surely does make a nice feed.

Refill the nests with clean straw or shavings and dust the hens and pullets thoroughly with a good lice powder. Repeat this application in a week or ten days, for the nest especially. This should effectively destroy all body lice and those pests should not bother the birds for some time, especially if in addition to the dust bath a little powdered sulphur or lice powder is put into each nest.

Heavily fed pullets should be kept busy to keep them in order and prevent them becoming too fat before starting to lay. After laying is established they are not liable to put on fat enough to hurt them, but plenty of exercise won't do any harm. Exercise does not mean that you should make the birds work for every kernel they get. Exercise is a good thing, but it is not necessary to work them so hard that they burn up most of their food in making power for muscular work. Some time you can have too much of a good thing.

This is the season when some people sell off a lot of their pullets and hens "because they don't lay and grain is so high." Nine times out of ten their birds have had just enough food to keep them alive and in fair order, with no surplus for fat-making or

making eggs. If you can get a chance to buy such birds that are of good size and healthy, buy them. In from two to three weeks' time with a liberal ration you can get them laying and you can keep them laying all winter. Many will be sold for what it costs to raise them and less.

This month you should top dress all the poultry yards with thoroughly slacked lime and plow it under. After the ground has been thoroughly dragged sow rye or spring wheat and roll it in. In the spring, just when the frost begins to come out of the ground, sow a good mixture of clover seed in the rye or wheat. This will sweeten the soil and will yield an abundance of green good when the heavy snow comes off in the spring and afford green feed before the grass gets started.

See that your fowls have charcoal this winter. It is not a food, the fowls gain in flesh and eggs during its use; it simply puts them and keeps them in the best of condition for work. It prevents disease because of its great capacity to absorb gases, acids and impurities. In putrid diseases like roup, in fermentations like sour crop, in intestinal maladies like diarrhea or cholera it is of great benefit.

If you are so situated that you have an outdoor scratching place for your breeders, try it this winter. We believe that you will find it pays in better fertility and better eggs. The best plan is to have a straw stack or a stack of corn stover piled near the south front of the house, where the fowls can scratch all around the stack at will. If you can have a stack long enough to form an effective wind-break, so much the better. We don't know of anything that fowls take more comfort with in winter months than an opportunity to scratch around and about a stack of straw or stover.

If you use litter material, be sure that it is dry and free from mould or must. Good clean rye, wheat or oat straw makes the best litter; corn stover cut in short lengths comes next. Don't get shredded corn stover too deep when it is first cut, as it is likely to heat, and heat quickly. Waste hay makes fairly good litter. Planer shavings are good, but like sawdust hold moisture and are liable to become musty. We like leaves least of all, for litter and oak leaves we don't like at all. These last appear to be more liable to hold dampness and to contain fungi of various sorts. Some cases of canker and other diseases noted on some places we have visited appeared to be directly traceable to mould or other undesirable matter introduced in leaves gathered in scrub oak woods.

The cockerels should now be developed and gotten into condition for show, use or for sale. Cull down pretty close so as to have only the best ones left, for a first-class bird is an admirable advertisement, but a mediocre specimen is a positive damage to your reputation. Those you do not want to keep should be gotten into market condition and then into market, in order to realize more profit from them and reduce the feed bills.

The best way to fatten turkeys is not to confine them, but feed them all they will eat before leaving for the range and when returning at night. The youngsters will take to the range after eating and will get enough exercise to promote digestion while engaged in securing the fresh vegetables and animal food necessary to properly balance their ration. We find that corn and wheat are the best foods for fattening. Before killing the stock keep them for eighteen hours in a clean, airy pen and give no food. They may have water up to within eight hours of the time of killing, for water gives a healthy look to the skin and assists in cleansing the digestive organs of matter which would sour and taint the flesh. Turkeys intended for market should be dressed and forwarded in time to reach their destination a few days before Thanksgiving. Late arrivals are seldom in as great demand or realize as high prices.

Establishing the Hens in Winter Quarters

(Continued from page 997)

night comes on.

The litter for the winter laying house is of paramount importance. It should be: Clean, and not particularly dusty. Dry, above all things. Cheap, in order to be economical. Plentiful, for the fowls will scratch about in it for exercise, and will live in it and on it all the time.

The best litter, in the opinion of the writer, consists of a mixture of oat straw and pine shavings. Rye straw, or wheat straw is also good. The shavings absorb moisture quickly and help to keep the litter

in good condition. In many places these may not be available. Use about eight to twelve inches of litter. Change it when conditions justify.

Equipping the Winter Quarters

In closing this article, the primary message of which is to urge the confinement of the layers during winter months, and providing them with a sanitariously cleaned house, a word fits in well concerning the necessary equipment for this winter home of many birds.

Allow from three and one-half to four square feet of floor space per fowl in winter quarters.

Provide a constant supply of fresh, clean water where it is accessible to all fowls in the pen.

Provide mash hoppers in sufficient amount to encourage the increased mash consumption needed to assure winter eggs. This means a six-inch space along the side of the hopper for every two or three fowls. The open box hoppers are best.

Give new mash frequently, and keep the supply stirred up.

Provide grit and shell in separate hoppers. A nest for every four or five fowls is needed, especially if they are trapped.

Keep all equipments up off the floor, so that the entire floor space is available for the working fowls.

Handle the fowls on a business basis and they will respond in like manner. Neglect them and they will not lay.

Early Layers of Good Size

I have seen letters regarding early laying pullets and answers to them saying the birds were not matured and would lay small eggs and also stay small themselves. Now, I have a small flock of S. C. White Leghorns consisting of 65 pullets. One of them started laying when one day less than four months old. I weighed a number of them at four months and found they were from 3 pounds 8 ounces to 3 pounds 12 ounces. That is the weight of an exhibition Leghorn pullet when mature. At six months a number of my birds weigh about five pounds. They are laying better each day.

The hens from which I got the eggs to produce these pullets laid at four and a half months. Most of them are over four pounds, one that died weighed over six pounds. The flock averaged over 160 eggs for their first year and were not culled until more than half the year was gone.

From 200 eggs I hatched 165 good strong chicks. A few weak ones were thrown out on being taken from incubator. I raised 164 to a month old, sold 20 pullets and at 12 weeks sold all the cockerels but five, and they averaged almost three pounds.

My pullets are very uniform in size. There were no small ones in lots of cases.

I have installed electric lights in the laying houses and expect a much better average this year, as the culling is being done much earlier.

The small Leghorn does not find favor with the dealers here, so it's a case of make them grow to sell them. While in the brooder house I used to go out to them about 10 o'clock each night and let them fill up on growing mash and drink all they wanted, and I think that helped them to make such good growth. HENRY DEMPSEY.

Connecticut.

Broodiness

At the Harper-Adams egg competition in England, it has been found that the highest averages are held by birds that have been broody once or twice, but the average for those that have been broody three or four times is practically the same as those that have not been broody at all.

It is interesting to notice that the typical sitting breeds do not seem to be greatly benefited as regards output by having the brooding instinct bred out. The Rhode Island Reds, light Sussex and Orpingtons all show a higher average when the birds have been slightly broody than when they have gone through the test without showing the inclination to sit. . . . In the case of the Rhode Island Reds no appreciable difference in seen in the output, even though the birds have been broody six times, and in the case of the Sussex the non-broodies of this breed are hopelessly out of the running from the point of output.

Eggs that are kept close to onions, cabbage or kerosene absorb the odors of these materials. Feeding such things as onions will also give an unpleasant taste to the eggs. This loss can be prevented by keeping the eggs in a dry place, away from offensive odors and by feeding only desirable materials. The egg basket should always be covered to keep off the flies.

ROUP

It's choking to death thousands of chickens a day. You know the symptoms—face swollen, running at eyes and nose, comb pale, whistle or sneeze when breathing, catarrhal odor. When it attacks your flock—

By GEO. H. LEE

Mr. Lee is author of a score of books on poultry, having a distribution of more than TWENTY MILLION copies. He considers as best of all, his latest book

"POULTRY TROUBLES"

There are climatic troubles; seasonal troubles; neighborhood troubles; epidemic, accident, vermin, housing and feeding troubles—their PREVENTION and TREATMENT all told in the plain, easily understood, common-sense way for which Mr. Lee's writings are famous.

It's worth reading. A copy may be had FREE from any dealer handling Lee's Lice Killer and Germozone, or from GEO. H. LEE CO., Dept. P-2 Omaha, Nebr.

WEBER'S Best laying, best paying chickens, ducks, geese & turkeys. Fine pure-bred quality. Fowls, Eggs, Incubators all at cut prices. 41 years poultry experience, and my 100 page Catalog and Breeders Guide Free. W. A. Weber, Box 56, Mankato, Minn.

The Old Breeds.

I have been reading in the Journal the discussions in regard to admitting certain new varieties of chickens into the Standard of Perfection. Some, in writing, are inclined to be liberal by advocating that the more popular non-standard breeds, such as the Jersey Black Giants and the Rhode Island Whites are deserving of recognition.

The average reader on first thought will probably say that they have the prime requisites to entitle them to admission to our most valuable book, which I am not disputing. On the other hand, what will be the result of their admission? Will the poultry world be benefited to any extent? We have all heard of the wonderful Jersey Black Giants but little has been written or said in favor of the good old breeds such as the Brahma. Yet the latter is fully as good layer, as large, as beautiful and make fully as fine capons as the Giant. They even command a higher price for in our section of the country a black chicken sells for about five cents lower than another per pound.

Where would the cattle and hog raisers of the country be today were they forever endeavoring to produce new breeds? The reason they have the splendid breeds of hogs and the heavy milk producing cows is because men have selected a breed and stuck to it through difficulties instead of trying to produce some new breed. Some wish to get a Rhode Island White when they already have a Rhode Island Red which is fully as good and as beautiful. Whoever heard of a red Duroc-Jersey hog raiser trying to produce a white Duroc-Jersey? If these people do not approve of a red chicken and want a white one they have at their command the White Rocks or the White Wyandottes.

I am an enthusiastic breeder of Silver Leghorns, a beautiful as well as profitable Standard breed seldom if ever mentioned in a poultry journal, yet they are worthy of the efforts of many ardent breeders. Human nature is such that we are always grabbing for something new and when we have that, we long for something else, never being satisfied with that which we have. However, I sincerely hope that anyone going into the poultry business will consider the qualities of some of the lesser known, yet deserving Standard breeds of poultry.

Kansas. Natnan H. Bolton.

The Year-old Hen.

The time of year has come, when the pullets must be moved into the laying houses. So we must decide how many of the year-old hens we will sell to make room for the pullets.

This decision will differ with the flock kept primarily for commercial egg production, and the flock that is mainly a breeding flock. It is definitely known that a hen lays her greatest number of eggs during her pullet year. So the commercial egg flock will be made up mostly of pullets.

However, it is an equally well-established fact that chicks hatched from the eggs of year-old hens are larger, stronger and possess a certain spark of

In my last month's advertisement I offered to send every poultry raiser who would send me their name and address a free catalog-folder, telling all about the New Improved Sol-Hot Brooder Oil Burning Stove.

Our mailing division has been very busy sending catalog-folders to the thousands who answered my advertisement. **Did You Write and Get Your Copy?**

If not, do it now—write your name and address on coupon on next page—mail coupon to us and get descriptive folder by next mail.

New Improved Sol-Hot Brooder Stove is Years Ahead of All Others

Ever since the first oil burning canopy brooder was made, manufacturers have been striving to make a burner that would overcome the faults so common with most style heaters; namely, irregularity, spasmodic oil flow, tendency for burner to go out, stifling of chicks with oil or gas fumes, inability to adjust oil flow so that heater would burn uniform, wouldn't go out, wouldn't flare up, wouldn't smoke, etc. Every poultry raiser who has had experience with oil burning brooders knows how discouraging it is to try to raise chicks with a brooder having these faults.

That's just why I want you to send for my catalog folder and learn all about the New Improved Sol-Hot—the brooder Stove that positively overcomes all of these objectionable features; it is the only heater of its kind on the market—it is years ahead of all others. **Read next page, then be sure to fill out and mail coupon—learn all about the New Improved SOL-HOT.**

The BEST is the CHEAPEST

The New Improved Sol-Hot Heaters or Stoves for Canopy Brooders and Incubators absolutely overcome all the objections, annoyances, worry, dangers, etc., so common in the old style heater. When you start your Sol-Hot and set the flame where you want it, (an operation requiring less than three minutes time) you don't have to lay awake nights worrying about it. You don't have to be afraid to go away from home for a few hours for fear your brooder heater will go out and thus lose a lot of your chicks. You have the positive assurance that Sol-Hot will burn **just as you left it as long as the oil supply lasts**. It can't go out—can't overflow—the flame can't vary.

The New Improved Sol-Hot produces a steady uniform heat to any desired degree without wicks—without odor or without smoke—so simple and safe an eight year old child can operate it and

As Dependable in Service As a Clock

Twelve years ago the first wickless oil burning stove for brooders and incubators was produced—it was a Sol-Hot—it has been in the lead ever since, and each year it has been improved and simplified until today The New Improved Sol-Hot with its Double Oil Control—Just-rite Valve and Dial—Bigger Better Burner—comes nearer to perfection than any heater ever before offered poultry raisers.

Sol-Hot's Double Oil Control is accomplished by its Auxiliary Oil Chamber and its Just-rite Valve and Dial. The extra Auxiliary Oil Chamber entirely eliminates the "flare up" that occurs on "open pipe" feed heaters. The Just-rite Valve and Dial permits you to control the oil flow perfectly and makes possible a steady uniform flame at the burners under all conditions.

Sol-Hot is also equipped with my patent Metal Vaporizer—one of the **biggest** little devices ever invented for oil burning heaters—it replaces the old style asbestos rings that quickly get hard—covered with carbon and smoke and cause an uneven flame.

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICEMIST." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang un-corked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Lice-mist vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54, Quincy, Illinois.

"GETTING EGGS THIS WINTER"

"I am still using the two Putnam Stoves," says Max Otto, of Tom's River, N. J., "which I ordered from you about seven years ago, with excellent results. I am getting eggs this winter when others barely got an egg." Growing green food in winter, such as sprouted oats, is necessary to egg production. The Little Putnam Stove furnishes just the right amount of heat to sprout oats and will burn one month without attention. Get one from your dealer or write I. Putnam, Route 1105-R, Elmira, N. Y., enclosing \$2.00.

A Little Putnam Stove will be promptly mailed to you postpaid. Satisfaction guaranteed. See advertisement on page 1032.—Adv.

vitality that carries them through the age of baby chickhood, when less hardy chicks will die.

We had a very interesting experience along this line, during the past breeding season. We made up two special breeding pens and gave them equal care, as nearly as possible. Pen No. 1 contained twelve of our best S. C. Rhode Island Red year-old hens, mated to a good cockerel. Pen No. 2 contained twelve of our very choicest pullets, mated to a full brother of the cockerel in Pen No. 1. The chicks from these pens were pedigreed, and we kept a very accurate record of them. This was the result. Nearly all the chicks that we lost were from eggs from the No. 2 pullet pen. While we were able to raise nearly all the chicks hatched from the eggs of the No. 1 pen.

Another argument in favor of keeping the year-old hen as a breeder is that in flocks where trapnesting is practised, the year-old hen's ability as a layer is established. And in this case, only the very finest specimens that also have high egg records, may be kept as breeders.

A great deal is written about how to select one's best hens by culling, and the proper time to cull. And constant culling is truly the only way to keep one's flock on the upward path. But the time and manner of culling varies with almost every individual flock.

Our flock of S. C. Rhode Island Reds is primarily a breeding flock. But we aim to breed Reds to standard size and color, with high egg records. So we trapnest our hens persistently, and each year, we find more hens with records of over two hundred eggs.

We are fortunate in having a standing order for a few hens to be delivered each Saturday to a local restaurant. So the results of our trapnesting, coupled with ordinary culling practices, result in a process of weekly elimination of a few birds.

During the Fall and early Winter, we pick out especially the color culls. Then as the Winter advances, and we are getting a pretty fair idea of each pullet's trapnest performance, we sort out the birds that show the least promise of becoming heavy layers. This brings us up to the breeding season, with all color culls gone, and only the most promising layers left.

And now at this season, we cull most rigorously for vitality. Any hen that shows the least lack of constitutional vigor, must go. For we consider that these are unfit to be used as breeders.

As Summer advances with each quota that goes to the restaurant, it becomes more difficult to take out the next lot. But we always find a few that are becoming broody too often, that are for some reason falling down in egg production or that do not quite come up to our color requirements.

When Fall comes, and it is time for our pullets to go into their permanent laying quarters, we find that a large percentage of our laying flock has been weeded out. Sometimes in order to make room it is necessary to reduce this flock still further.

It is our idea to keep twenty-five

16 Hens Laying 14 Eggs a Day

Chinese Tablets Work Wonders for
Mr. Baley. Easy to Try.

"We didn't have much confidence in Don Sung, so we tried it first on 16 hens. We started Jan. 20th, when these hens were laying almost nothing—2 or 3 eggs a week. In three weeks, they were laying 10 to 14 a day, or over 6 dozen a week. I'm glad we gave Don Sung a trial. We can't praise it enough."—H. H. Baley, Clifton, Texas.

Six dozen extra eggs a week, at winter prices! And a \$1 package of Don Sung lasts 16 hens 3 months. No wonder Mr. Baley is glad he tried it.

It may sound too good to be true. That's what Mr. Baley used to think. But we'll prove it to you just as we did to him with this offer:

Give Don Sung to 15 hens. Then watch results for 30 days. If it doesn't show you a big increase in eggs, if it doesn't pay for itself and pay you a good profit besides, tell us and your money will be promptly refunded.

Don Sung (Chinese for egg laying) acts directly on the egg-laying organs, and is beneficial in every way. It makes hens healthy and happy. They scratch and sing. Pullets develop earlier. The whole flock lays regularly in any season, in any weather, when eggs are scarce and high.

Can you afford to ignore the wonderful reports you are hearing from Don Sung users everywhere? Why not let us show you the same results, with your own flock? Don Sung is no trouble to use. It costs nothing to try. All we ask is a chance to prove our claims, entirely at our risk. Get Don Sung from your local dealer, or send 50 cents for package by mail prepaid (large size, \$1, holds three times as much). Burrell-Dugger Co., 407 Columbia Bldg., Indianapolis, Ind.

per cent of our year-old hens each season, to be used as breeders the following year. These hens are the very cream of the flock and will lay as well during their second year, as the average pullet. By following this plan, our egg production is kept up to our standard, and we have the advantage of being able to use these excellent year-old hens, each with her individual record of performance back of her, in our special breeding pens. Pennsylvania. Mrs. James W. Maule.

The Commercial Egg Farm.

As we have had considerable experience with the methods practiced on commercial egg farms, and have been acquainted with several poultrymen who have been remarkably successful with such farms, we have prepared this article from our own experience and that of others, with a view of helping any who may be contemplating the starting of a poultry farm.

One rather remarkable success is that of our neighbor who started with 200 chicks a few years ago and who today has 2000 laying birds and had over 4000 chicks in his brooder houses the latter part of March. He mapped out a plan and has clung to it tenaciously with continued success. He started on a small place but soon outgrew it and leased a large farm, which he has already, in less than five years, made a considerable payment on.

Briefly summed up, his plan is as follows: Chicks are purchased or hatched in March. As he has not had sufficient incubator capacity to hatch the required number, many have been purchased. This year he has contracted for 6500 for delivery before April 1. This seemed the better method, as he had the 200 layers to care for and the work has been done by himself and wife. In fact the only help hired has been during the season of farm work. Starting with the purchase of chicks, he brings them to laying as early as possible. Usually by early autumn he is getting a considerable number of pullet eggs. Meanwhile, all cockerels are sold for broilers as early as they reach the proper size. The hens are also culled during the spring and summer. All old birds are sold by the middle of October unless he wishes to keep a breeding pen. The last year he did not find it advisable to do this, however. He believes that his system of forcing gets about all there is in a hen without keeping her over two winters. In brief, his system is to bring the pullets to the laying age as early as possible, force them during the winter by artificial lighting and begin to cull and sell when the birds show signs of molting. His feeding formulas are of the standard recommended sort and he feeds by rule, in other words, just a certain number of pounds of scratch feed are fed to a certain number of birds. The mash is given without stint. Pullets are allowed to range in the orchard until they begin to lay and then they are put in the laying houses and never leave them again until they go to market. This man has stuck to a certain strain, buying chicks each year from the same hatchery. Thus he has not mixed his flock. Of

The Heart of the Hen is the Life of the Chick

Could She Hatch
Her Chicks
Without a Heart

THIS HOME MADE SPROUTER Provides Plenty of Green Food

The little girl shown below is Dorothy Lappe. She is justly proud of the home-made sprouter built by her father, Henry Lappe, Butte, Nebraska. You can see for yourself that the oats are growing "like weeds." This is due largely to the Little Putnam Stove which provides a mild, even heat and is fire-safe. Mr. Lappe writes: "There is nothing like the Putnam Stove."

This is Dorothy Lappe. She has learned the secret of getting winter eggs.

One hundred pounds of sprouted oats will combine with air and water to make 350 pounds of the most economical and nourishing green food obtainable. A sprouter, such as shown here, enables you to reproduce spring-time conditions in mid-winter. The hens show their appreciation by shelling out eggs, regardless of the thermometer.

You can build an oat sprouter as efficient and practical as this one at a cost of \$2.49 or less. Mr. I. Putnam, Route 1105-R, Elmira, N. Y., will send you complete instructions on request. Write for them today. See advertisements on page 1032.

course it does not matter when all the chicks are bought and no breeding pen kept.

Another poultryman of our acquaintance has made more than two thousand dollars profit from his hens in the past year. This man practices a different system. He has built up a strain of excellent layers and does a considerable business with day-old chicks. These he sells locally during March, April and May, besides hatching two to three thousand chicks for himself. He also tells a good many hatching eggs. His methods are somewhat like those of the man named above so far as the commercial flock is concerned but in addition he keeps over several breeding pens and sells a few cockerels at good prices. This man also practices artificial lighting except with the breeding pens. Breeders are not forced for winter laying, hence he has become noted, locally, for furnishing "eggs that hatch." Both of these poultrymen keep nothing but Rhode Island Reds.

Our own methods are more like those of the last named. We find it profitable to keep over the breeders, also to sell hatching eggs and cockerels for breeding purposes. All other males are culled out for broilers at the earliest possible moment. Also we cull the old birds, often commencing to ship in April. It seems to us true that birds which begin laying in October and keep it up all winter have paid a pretty good profit, then if we sell the hen for from two to three dollars, that sum, at least, is all profit. That same hen would take a long vacation during the summer and fall and would not lay again until the next spring. Pullets intended for the breeding pens are not forced for winter production. These birds will lay some during the short days but not like those in the pens which are lighted. Our birds which are not forced during the winter are often used for the breeding pens the first year. Nevertheless, we find it advisable to keep these birds two years. All others go to market at from fifteen to twenty months old.

For eggs after the first of September we depend almost wholly upon pullets. The old birds are pretty nearly cleaned out at least by October. We are not prepared to give any figures but know that these methods adhered to will bring success. We believe that a hen should be kept only so long as she produces abundantly. Feed her all she will eat and keep her laying for eight months and then sell her. If you keep her much longer than that after she begins to lay, she will have to have a vacation. She will not stop eating, though, so our method is to sell her for what she will bring. Our experience and observations have been largely with general-purpose breeds. New Hampshire. C. H. Chesley.

The use of green feed of some kind is of considerable importance in keeping birds in good condition during the period of confinement. Sprouted oats, silage, mangles, cabbage, or pumpkins give good results. When sprouted oats or silage are fed the amount should be what the flock will consume in a half hour, once a day. When using mangles or cabbage the amount should be what will be consumed in half a day.

1000 Eggs in Every Hen

New System of Poultry Keeping—Get Dollar a Dozen Eggs—Famous Poultryman

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then, she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860-S, Herald Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.

Brower's Non-Freeze Lampless Poultry Fountain

Keeps water at drinking temperature winter and summer; cool in summer and warm in winter. Made of galvanized iron, on principle of thermos bottle, with lined and sealed air space between. Order from advertisement. Satisfaction guaranteed or money returned.

1 gal., \$2.50 — three for \$6.75
2½ gal., 3.50 — three for 9.50
5 gal., 4.50 — three for 12.00

Shipping Stock and Eggs.

By Chas. F. Stem

It is an advantage to a breeder of pure bred poultry as well as all others interested in the advancement of Poultry Culture to have their shipments arrive at their destination in good condition.

It is the duty of every breeder to furnish everything required for the safety and comfort of the fowls shipped by him. It pays to use attractive coops, because they command respect and receive a great deal better care from the handlers enroute, and if the breeder will have an appropriate label bearing his name and address, and the varieties he breeds, upon his coops, it will prove to be an excellent advertisement, and some times yield splendid returns. All these little points go toward making the breeders' success more certain.

A great many shippers make the mistake of shipping in boxes or crates that are unnecessarily heavy and greatly add to the express charges.

I have noticed shipments of fowls being made in large heavy boxes that were made out of heavy 1 inch oak lumber. The box which I have in mind contained one cockerel and one hen, and the shipment was billed as weighing 60 lbs. This was enough to discourage the party who received them. Again, we will find fowls shipped in a coop that is just about large enough for half of the number, and not tall enough for the birds to stand in. This kind of a shipment is a very bad advertisement for the breeder, and is some times the cause of birds getting out of condition to such an extent that the buyer will not accept them.

No bird, for which the purchaser pays his good money, should be delivered in a coop that prevents it from standing comfortably in a natural position, whether the journey is for 50 or 100 miles. All birds sent out should have room enough to stretch to their full height and to scratch in the litter in the bottom of the coop for their food. A coop 12 inches wide and 18 inches in length is about right for one bird of the American varieties. When more than one bird is to go in one coop, no greater number should be placed in it than can sit together upon the bottom of the coop comfortably, and with a little room to spare.

In shipping birds in cold weather they must be protected from drafts, but still be supplied with plenty of air to breath. If they are set out on a depot platform somewhere to sit there the greater part of the day, they must have protection from the cold wind. They must also be protected from the steam pipes in the steam heated express cars. The coop must, therefore, be built with sides and ends wind proof to a height greater than that of the bird when standing naturally, and the air must be admitted through the top or sides next to the top. A slatted top is the best, and will allow plenty of air for the birds, provided there is nothing set on top of the coop, in which case all the air will be cut off if there are not places for ventilation near the top or the sides. When air is admitted in both

Make Your Hens Earn Year-Round Profits

WHETHER eggs are up or down, the only hens that pay their keep are the hens that lay. And it isn't the show bird that puts the most cash in the egg raiser's pocket—it's the bred-to-lay hen—if you pick her right, if you house her right, if you feed her right, if you keep her always in good trim. The poultry guidance of **THE COUNTRY GENTLEMAN** is written to tell you how to do it. In a single year it has printed the equivalent of 665 standard book pages of reliable poultry practices—all written to help make the farm flock pay.

THE COUNTRY GENTLEMAN is national in vision—its farm-trained experts travel the country over to seek out the methods that spell success to progressive farmers. In its pages you get the combined

When Biddy McCluck hits the market right, she's the barn-yard millionaire.

experience of practical poultry farmers in every corner of the land—the sound, fact stuff that helps you in your business. It pays, in dollars and cents, to read—

The COUNTRY GENTLEMAN

The coming issues of **THE COUNTRY GENTLEMAN** will be crowded with especially helpful material. **HARRY R. LEWIS** President of the International Baby Chick Association, will tell how to pick the winter layers, and will contribute enlightening articles on the poultry breeds, as well as a monthly page of meaty poultry pointers. **JAMES DRYDEN**, who produced the first official 300-egg hen and the first 1000-egg lifetime layer, will tell how a California poultryman makes his hens pay him \$10,000 a year, and will offer other articles on breeding, housing and the cure of diseases. **RALSTON R. HANNAS**, of the New Jersey Experiment Station, will write of simple remedies for common ailments. There will also be articles on many practical aspects of the business by **F. W. KATZMEIER**, owner of one of the largest hatcheries in Texas; **G. E. HENDRICKSON**, a successful Wisconsin operator; **LENA MARTIN SMITH**, who has been unusually successful with a farm flock; and men and women all over the country who have discovered the poultry plans that pay—the year round.

Perhaps the most remarkable series immediately in view is that on egg marketing

problems. The best investigators in the field will picture rully and competently the exact market situation for your product today. **MR. DRYDEN** will discuss the Far West; **JAMES H. COLLINS** the New York City situation; **P. S. LOVEJOY** the Chicago glut; **E. V. WILCOX** and **WILLIAM JOHNSON** the Middle West. This, we believe, is the biggest egg-marketing investigation ever undertaken.

And poultry guidance is only a part of the service of this national weekly. It covers every farm interest and in every issue offers fine new fiction by such favorites as **ZANE GREY**, **WILLIAM MACLEOD RAINE** and **ALBERT PAYSON TERHUNE**. If you know what it's worth, then you are already a regular reader. If you don't, then we want you to see for yourself why you need it.

As a special introductory offer, we will send you thirteen helpful and entertaining issues for 25c.—in cash or stamps. We take the risk.

MINERALIZED WATER ROUTS CHICKEN LICE

**Tablets Dropped into Drinking Founts
Banish Vermin. Make Fowls Grow
Faster and Increase Egg Yield.**

Any poultry raiser can easily rid his flock of lice and mites, make chickens grow faster and increase their egg yield by simply adding minerals to the fowls' drinking water. This does away with all bother, such as dusting, greasing, dipping and spraying. The necessary minerals can now be obtained in convenient tablets, known as Paratabs. Soon after the fowls drink the mineralized water,

all lice and mites leave them. The tablets also act as a tonic conditioner. The health of the fowls quickly improves, they grow faster and the egg yield frequently is doubled. Little chicks that drink freely of the water never will be bothered by mites or lice.

The method is especially recommended for raisers of purebred stock, as there is no risk of soiling the plumage. The tablets are warranted to impart no flavor or odor to the eggs and meat. This remarkable conditioner, egg tonic and lice remedy costs only a trifle and is sold under an absolute guarantee. The tablets are scientifically prepared, perfectly safe, and dissolve readily in water.

Any reader of this paper may try them without risk. The laboratories producing Paratabs are so confident of good results that to introduce them to every poultry raiser they offer two big \$1 packages for only \$1. Send no money, just your name and address—a card will do—to the Paratab Laboratories, Dept. 811, Coca Cola Bldg., Kansas City, Mo., and the two \$1 packages, enough for 100 gallons of water, will be mailed. Pay the postman \$1 and postage on delivery, and if you are not delighted with results in 10 days—if your chickens are not healthier, laying more eggs and entirely free from lice and mites—your money will be promptly refunded. Don't hesitate to accept this trial offer as you are fully protected by this guarantee.

these ways there is little danger of insufficient ventilation.

It sometimes happens that a breeder will ship two male birds in the same coop, and the chances are, when they reach their destination they will be all bloody, and perhaps one of them dead from fighting. When shipping any great distance it is better to separate the males from the females because an ill-tempered bird, irritated by confinement, may injure his mates by constantly annoying them. All partitions separating males should be strong, so that they will not be easily broken down and thereby enable the birds to get together. Cotton cloth is not sufficient for the purpose, as it is too easily torn, especially if the coop gets tilted on the journey, letting the bird stand on the partition.

Cups for watering the birds should be attached to the coop in such a manner that they hang on the inside out of the way, but in such a position that access can be had to them readily for cleaning, also for placing water in them from the outside. Food must also be supplied on these journeys, and the most satisfactory way is to have a small box attached to the coop for holding the food; but if the shipment is to go only a short distance it will be all right to place the food in the litter.

The corrugated paper boxes as adopted by the Baby Chick Association, answer the purposes nicely for shipping day-old-chicks. These boxes are made in three sizes, 25, 50 and 100, 25 chicks being placed in each compartment. Holes for ventilation are provided on top and sides according to outside temperature.

There are a number of styles of corrugated paper boxes on the market now that give very satisfactory results in shipping eggs for hatching and market, sizes from 15 egg up to 100 and more. For shipping eggs for hatching in lots of 200 to 300 the ordinary market egg case answers the purpose nicely providing the eggs are packed carefully and well padded on top and sides with excelsior and labeled plainly on the outside that the eggs are to be used for hatching and must not be handled roughly. A great many shippers still use the peck and one half bushel market basket. This makes a very satisfactory way to ship and one to three settings can be packed in good shape in same, providing the bottom is well padded and each egg is wrapped in paper and then covered thoroughly in the form of a ball with soft excelsior also well padded on top and the top covered with either muslin or cardboard and then sewed on.

It is to the advantage of every breeder of fancy poultry to try to have all the satisfied customers he can get. They are good advertisements and it is the only thing that will make your business a success. Ship in light but strong attractive shipping coops and packages. In shipping fowls their comfort must be the first consideration. Stock and eggs well cooped and packed almost invariably arrive safely and in good condition.

A satisfied customer is what we must have if we intend to continue in the business.

Tri State Fair

By A. B. EMCH

The Tri State Fair of Memphis, Tenn., Sept. 25-30, 1922, was a record breaker in several respects. The poultry fanciers of Tennessee, Mississippi, and Arkansas, promised the Fair Association last year that if it would give them a new, up-to-date poultry building they would put up one of the greatest displays of poultry ever caged in the South. Both did their part. The fair association gave the poultrymen a new building and the poultrymen did more than they promised, for they brought an entry of over 3,000 birds.

The building is the best I have ever seen. There is plenty of room; single tiering, which gives the judges a good chance to do their work, and the birds can be seen to the

New Poultry Building at Memphis

best advantage. The building is a two-story construction. The pigeons and bantams are staged on the second floor. On account of the large entry this year, a few of the hens and pullets had to be cooped together. I am indebted to A. F. Rolf for the accompanying picture of this fine building.

The poultrymen have a real friend in Frank D. Fuller, secretary and manager of the Fair. On Tuesday afternoon Mr. Fuller came into the office of the poultry building and asked:

"Well, boys, how is everything?" They replied: "Just fine! But if the entries are larger next year we will have to double deck some of the birds." Mr. Fuller said: "That would spoil the looks of the display. I will add to this building and give you more room."

Carl A. Haid was superintendent of the poultry department and had everything in fine shape and received many compliments from the exhibitors. He was ably assisted by Miss Lillian Baxter as assistant clerk, and a number of fanciers. President McKinley well said at the Pan-American Exposition at Buffalo, N. Y., in 1901: "Expositions are the timepieces which show the nation's progress." That applies to great poultry exhibitions; they show the progress of the breeders' craft.

Judges: Conway, Taylor, Tormohlen and Emch. Barred Rocks brought out an entry of about 200 birds. Only exhibition classes were judged. There were quite a number of light males shown, and also dark females. The superintendent instructed the judge to place awards on exhibition birds only. Some good birds were shown, but we are sorry to say that there were a number of birds with badly twisted wings and no tails. The quicker the fanciers get rid of that kind of birds, the better it will be for Barred Rocks. There is more to a good Barred Rock than fine barred feathers.

White Rocks brought a nice class of over a hundred birds. The first cockerel would be our choice of the class. We cannot understand why there are not more fanciers breeding this grand variety.

The banner class of the show was the S. C. Reds with 308 birds, 18 cocks, 16 hens, 55 cockerels, 74 pullets, 3 old and 21 young pens, with extra good quality in every class. 1st and 2nd cock, 1st, 2nd and 3rd hen, 1st and 2nd cockerel, 1st, 2nd, 3rd and 4th pullet, 1st old and 1st and 2nd young pen were very good birds. Here is where T. W. Schoen, proprietor of Sunbrier Farms, really shone, winning among other things best display, and grand champion pen of the entire show, on his first young pen.

The next largest class was the S. C. White Leghorns.

We were somewhat surprised in this class, as we were told to look for a lot of large combs in that southern climate, but we found a lot of neat headed birds instead. We found a number of fanciers that are willing to pay good prices for what they want. Some good S. C. Browns were shown.

Buff Leghorns brought out some real high class birds. The star of the class was the first cockerel owned by L. B. Pence, win-

Keeler's Wh. Wyandottes

"THE WORLD'S GREATEST STRAIN"

THE ACE—First Cockerel, Chicago Champion Cockerel American Class

"The Aristocrats of The Breed"

Without an equal for show purposes and wonderful record egg layers. THE SUPER-EXCELLENCE of the Keeler Strain is the direct result of 27 years following a definite breeding programme. Haphazard methods in breeding poultry are as suicidal as going to sea without a chart. Anchor your faith in the Keeler Strain and steer straight to victory. The annual success of our customers at America's foremost shows lends argument to our claim, "The World's Greatest Strain." This proof of their exhibition excellence in the hands of others supplies the measure with which to gauge your possibilities. **YOU SELECT THE SHOW, WE SUPPLY THE WINNERS.**

5000--WHITE BEAUTIES--5000

(all Keeler bred) now on our farms insure matchless selections and makes possible those harmonious matings so necessary in exhibition pairs, trios, and pens, or the SUCCESSFUL BREEDING YARD. In 20 years of exhibiting we have never failed to win 1st cockerel or 1st pen. In the last 14 years we have never failed to win more points than all our competitors combined.

Exhibition males \$15.00, \$25.00, \$35.00, \$50.00 and upwards. Exhibition females \$15.00, \$25.00, \$35.00 and \$50.00 each. Exhibition pens \$50.00, \$75.00, \$100.00 and \$150.00. The Keeler birds will sustain or establish your name in White Wyandottes.

THE REXALL STRAIN---bred-to-lay

Is widely and favorably known because of their all the year round egg producing habits (200 to 288). Commercial poultrymen have found them especially adapted for winter egg production and are quite as enthusiastic over their merits as broilers. The 17 years of this line recommends their adoption. Breeders' males or females, either Rexall or Exhibition breeding, \$5.00, \$8.00, \$10.00, \$15.00 and \$25.00 each. Properly mated pens (one male and 4 females), \$25.00, \$35.00, \$50.00, \$75.00 and \$100.00. To those desirous of reading the complete story of our success we will forward our elaborate 50 page art catalogue (5 red stamps appreciated). A definite statement of your needs enables us to render satisfactory service.

Taylor Instrument Companies Rochester, N.Y. U.S.A.

ning special for best cockerel in the show. Some very nice White Wyandottes were shown in fine condition. Partridge Wyandottes, a good class; first hen winning special for best hen in the show. In White Orpingtons the quality seemed to be in the hen and pullet class.

We doubt if there ever was as good a class of fine Buff Orpingtons shown in the South as was shown at Memphis this year; 137 birds. Here Frank F. Conway, manager Mayslake Farm, showed them what real Buff Orpingtons were like, winning all first and second prizes, best display on Orpingtons, special for best cock in the show, also best pullet in the show.

Anconas were not a large class, but some real good birds were shown. Speckled Sussex also brought out some exceptionally good birds. There was also an extra large display of bantams and pigeons.

Black Plumaged Fowl

I have read with great interest the contribution "What the Market Demands in Poultry Breeds," by Edward F. Murphy, to which space was given in your September issue. As a result of my many years of experience in handling market poultry in New York, America's greatest market, and my knowledge of the trade requirements and preferences thus gained, I feel it my duty to publicly bring out certain facts which will tend to prevent the public from drawing incorrect inferences from certain statements appearing in the article referred to above.

The gentlemen quoted by Mr. Murphy are entirely correct in their statements to the effect that Leghorns and breeds of similar character do not sell—as table poultry—to the same advantage as heavier breeds. But their objections to black-feathered and black-legged stock might be misleading to the average poultryman unless carefully analyzed.

I would register no objection to such statements if they said "some black breeds do not dress well." But to condemn all birds with black plumage because certain ones are unsatisfactory is unjust and misleading.

Take, for instance, the matter of dark pinfeathers. If "dark pins" are a serious detriment, Barred Rocks would be discriminated against because birds of this breed have dark pin feathers. Yet the majority of the people quoted by Mr. Murphy refer to the Rocks as being very desirable table stock. It can't be that this is a serious fault.

I am of the opinion that Mr. Murphy confined his investigations largely to dealers in live poultry and I would like the reader to understand that my remarks are based on the dressed poultry situation.

In my opinion, the existing objection to black birds is not due to the color of the feathers, but to what this color indicates. It is true that most black breeds dress off with white or bluish white skins and our best markets prefer yellow skinned stock. Give any poultry buyer big-breasted, full-fleshed, yellow-skinned chickens and he won't care a rap about the color of the feathers, whether they are baby blue or shamrock green. What he wants is what his trade calls for, and for the desired quality he will pay well.

For twenty-five years I have been handling large quantities of fancy dressed poultry of all descriptions and my trade has never been interested in the color of the feathers that formerly clothed the birds supplied them. They look for rich yellow color and plump carcasses. Given that, they are satisfied. After reading Mr. Murphy's article, I asked five of the largest dressed poultry dealers in the city of New York as to their ideas, and in all cases their opinions and experience agreed with mine. So the best trade in dressed poultry does not discriminate against black-feathered stock as such.

On this point exclusive dealers in live poultry can scarcely give accurate and unbiased testimony because choice table poultry is seldom shipped to market alive. It is an open secret in the trade that the greater part of live poultry shipped in is mixed stuff picked up on the farms and culls from the big packing houses and poultry plants. Table poultry of high quality sells to better advantage and brings in a bigger profit when dressed. With the feathers off the real quality of the stock is at once apparent. Poor stuff is scarcely worth the expense of dressing. Further, if mixed with the high-grade dressed stock it hurts the entire shipment and lowers the price paid for same.

The big poultry packers and the thoughtful poultry raiser know this. Therefore, they carefully dress and pack their choice stuff and ship alive the refuse, the poor, skinny, hump backed, crooked breasted, scaly legged birds, permitting the feathers to cover, so far as possible, these defects.

There are exceptions, of course. Many

poultrymen having small establishments do not possess and, because of the limited extent of their business, cannot afford to install proper facilities for dressing and cooling their birds. Such send some mighty good live stuff to our market, usually by express. But such shipments are but a drop in the bucket compared with the carloads, even trainloads, of live poultry which reach us from all parts of America. The bulk of the latter is inferior.

The argument against table poultry having black feathers falls flat in the face of the fact that the choicest and most popular table birds which reach the market—the Philadelphia roasters, capons, fowls, pullets, etc.—are black feathered and black-legged birds which dress off round, lump and meaty and have the golden yellow skin which is so strongly preferred by buyers. These top-notch birds are Jersey Black Giants, produced many years ago by specialist breeders of fine table poultry and recently admitted to the Standard of Perfection. I have been a seller of poultry many more years than I have bred poultry and I still devote much of my time to our business in New York market. Our great specialty has long been the handling of choice grades of table stock. If there is a breed of fowls that has equal or better table quality than the Jersey Black Giant, I want to know what and where it is. To date I haven't found it. In my opinion, as an experienced dealer in choice table stock, the best of the lot is this big, meaty, black bird.

Mr. Murphy also speaks of the New York market's preference for white-shelled eggs and the fact that the consuming public here is gradually realizing that a good brown-shelled egg is just as desirable as a good white-shelled egg.

This prejudice in favor of white-shelled eggs is largely due to the following conditions which have affected the quality of the stock reaching this market. For a great many years the exclusive poultry farms in the nearby districts have been stocked with Leghorns. The eggs from these close-at-hand plants regularly reached the market in perfect condition, fresh and sweet. On the other hand, the brown-shelled eggs collected from general farms in distant states, particularly in the days before methods of collecting and shipping had been perfected, were often in rather poor condition before being distributed to consumers in New York.

Now what happened? The consumer bought a dozen white-shelled eggs and found them good, not because they were white, but because they were fresh. He bought a dozen brown-shelled eggs and found them stale and musty, not because they were brown, but because they were old. Naturally, he then regularly selected white-shelled eggs when making his purchases and so the demand was created.

Because the New York market pays a premium for white eggs the producers in distant states have taken up the breeds which produce such eggs. No longer does a white shell indicate quality, and I can see a decided change in sentiment. Buyers now commonly ask for "guaranteed fresh eggs" instead of specifying color of shell. While it will take some time to break down firmly established customs, I feel that in course of time common sense will replace baseless prejudice and that premiums will be given for truly fresh eggs regardless of exterior color.

Let me have a steady and generous supply of big, brown eggs which are new laid, and I will undertake to sell them on a par with white eggs of similar quality. To do this it is necessary to have the required supply because a steady demand and dependable trade cannot be built upon scanty or irregular supplies.

New Jersey. U. L. MELONEY.

Chickens Do Best When Not Confined

Sprouted oats, added to winter poultry rations increase the fertility and hatchability of eggs but as far as the number of eggs is concerned it seems to be immaterial whether they are fed dry or sprouted. Corn silage in small amounts helps production of eggs and increases the hatchability. Dried beet pulp is of doubtful value as a poultry food. Semi-solid buttermilk gives good results as to health of fowls and the number and hatchability of eggs. Fowls allowed to run out doors during winter laid better than those shut in.

These facts briefly summarize the results of experiments conducted by Harold Atwood, for the West Virginia Agricultural Experiment Station. The experiments were conducted on the University poultry farm at Morgantown, during the winters of 1920 and 1921.

Egg Bred Certified White Leghorn Chicks

from our Famous Certified Winter Egg Basket Strain S. C. White Leghorn hens mated with 250-300 egg Pedigreed Sires from Hollywood & Bealls direct. 33% More Eggs

GREATER VITALITY---BETTER HEALTH

Nature didn't make a hen to lay more than one batch of eggs a year. Scientific feeding made the high producing hens of today. Large egg production calls for more minerals than the hen gets from the usual rations. Murphy's Mineral Feed supplies the need and makes brighter, more active hens with redder combs and a big increase in egg production.

MURPHY'S FORMULA MINERAL FEED

Experiments of the U. S. Department of Agriculture show that the addition of minerals to the usual ration results in a gain of 38.66 per cent.

Trial order of Murphy's Mineral Feed—P-O for Poultry: 10 lbs. enough to mix with 200 lbs. of mash, \$1.00 F. O. B. Delavan. Order today. We guarantee results. Literature on request.

Capons

I was just reading my September number of A. P. J. and I notice under the heading, "Capons," written by Mr. L. E. Rouch, Illinois, a discussion of the subject on which I want to take issue.

I am a breeder of White Wyandottes. I also raise Barred Rock cockerels for capons (eating the pullets). I caponize them before they are well feathered out, or when the bean is about the size of a grain of wheat. I immediately turn them out with the other birds. I have never lost one by disease or vermin. I have only killed two birds during the operation. I never allow lice and mites to infest my house or birds.

I find among all the birds I have caponized that the capons grow much faster, while they do not fatten until they get their full growth of 9 to 10 months. They never drop around or become diseased.

My capons are with my other fowls at all times. They get plenty to eat; the only bird that runs them is the old cock bird, who is the boss of the whole bunch of fowls. He does not fight them any more than he does the rest of the bunch. My capons roost with the other birds, being scattered among the rest of the fowls.

I have one Barred Rock capon which is 2 years old, weighs about 18 pounds, is healthy and has never drooped around for one minute.

Now, I think Mr. Rauch wrong in trying to discourage any one from raising capons, as there is more money made in raising them than in any other branch of the poultry business.

Ark.

HOMER FREELING.

In the August Journal R. L. Chamberlin covered the subject of capons in fine shape, the only comment on his article is to say that where he states that a capon's comb, wattles and spurs never develop, that they never grow and seldom molt, I would say that I have a yearling capon that has heavy spurs, over an inch long. He is a good grower and is now molting heavily. Of course, it is possible that there are exceptions either way.

The article on capons in the September Journal by L. E. Rauch was all new to me and what I have to say concerning the capon is in marked contrast to Mr. Rauch's statement. In any line of work there are two great sources of learning, one from the printed page, the other by actual experience in the work. For my further remarks I shall draw from the latter source.

George Beuoy says in his capon book, in reference to the capon: "They are not subject to disease like other poultry, hence stand confinement well." I am a novice at the capon business, yet in the past two years I have found that what Mr. Beuoy says of the capon is true.

In the past two seasons I have caponized between 80 and 90 cockerels, and while I have lost a few in the operation, I have seen none of the awful things Mr. Rauch charges to the capon. I have not lost a single capon outside of the operation, nor have I ever seen a sick one, nor have I seen any badly infested with lice. I have 18 young capons now and just before I began to write I examined thoroughly for lice and did not find a louse. The capons are four and five months old and not been treated for lice for at least 3 months. I also examined them for chickenpox, which they are exposed to, being right in the same pen with hens that are affected with the disease, and found no sign of the disease in any of the capons. It begins to look to me as though Mr. Beuoy knows what he says about the disease question.

I have never given a capon any extra care. I have a yearling capon that was in a pen with a \$15 pedigreed male and female of equal value, all of last Winter and Spring. When chick season came he mothered a brood of chicks. Now he is running with the young capons. Not much extra care, is it?

As to the operation greatly weakening the bird, I would ask, why? Of course, I know it is a delicate operation. It is no joke. But it is possible to caponize a bird without the loss of practically a drop of blood, and when the capon goes right on and makes four pounds more (than his sire weighed) in 10 months' time, it does not look as though it had weakened him so much after all.

In closing, let me quote H. A. Daniels, breeder of pedigreed Reds: "The secret of success in the poultry business is work." This applies to raising capons, as well as any other branch of the industry. The capon, however, is a peerless fowl; he is in a class by himself as a table fowl; and as a brooder of chicks I believe he has a good chance of holding this distinction.

The Golden Laced Wyandotte

By MELVIN F. UPHOFF,
Sec'y National Golden Wyandotte Club

Is there anything in the feathered world more beautiful than a richly colored, well-shaped Golden Laced Wyandotte? During the past five or six years breeders have been striving to produce a bird of rich golden bay ground color laced with greenish black, and now that we have succeeded in producing these richly colored birds the Standard has been changed to read "rich golden bay" instead of "golden bay."

Too many breeders have the idea that because they are called "Golden Wyandottes" the ground color should resemble gold, but the Standard really calls for a bay color and modifies it with the word "golden." The new standard will call for a rich golden bay; the ground color will still be bay, but of a deeper shade.

Even today a few judges continue to award the ribbons to birds of straw color, but progressive breeders have continued to breed a bird of darker ground color and have been rewarded by having the Standard changed. Even the original color called for in the Standard of 1888 was not golden but "bay" modified by the words "golden" and "reddish."

Much improvement has been made in type until today, many of the Golden Laced Wyandottes rival the Whites in this respect. But we still see too many tall, awkward, heavy combed males and long backed narrow females. They can be bred good in type as well as any other Wyandotte, but in their haste to secure narrow, even lacing and rich color many breeders have sacrificed type, and without type it isn't a Wyandotte no matter how good the color and lacing.

In my recent trip through the Middle West I saw many Golden Laced Wyandottes of rich color, but one point I noticed particularly. In nearly all of them was a dull, grayish black lacing instead of lustrous greenish black. Without this snappy greenish black lacing the birds looked dull and flat in color. Black capes on males especially are still with us, and when I spoke of this to one breeder who has bred the Golden Laced for 27 years he doubted that there were any bred that were correctly stripped to the last feather in the cape. However, a few breeders have succeeded in breeding good hackles and cape feathering; every winner at the last club show was good in this respect.

Mossiness still remains the big problem of both Silver and Golden breeders. It is easy enough to get clear cushioned pullets, but clear laced hens are few and far between. I have visited many breeders, but never saw any flock which molted over 10 per cent clear laced hens. In discussing this defect with one of the oldest breeders in America recently he stated that at one time he had a flock which were practically all clear as hens, but later he introduced new blood, and after that not more than one out of a dozen came clear. By breeding from males that are out of clear, clean laced hens, and that have clean open laced hackle, saddle and wing bar feathering, a large percentage of clean hens will be secured. Color has little to do with mossiness in my experience, the percentage of mossy hens in straw colored Golden Laced is just as high, if not higher, than in the rich golden bay birds. This mossiness is undoubtedly caused by the infusion of Partridge Cochins blood in the make up of the original Golden Wyandottes and to get away from it will mean years of careful mating.

Without proper feed and care the best bred chick in the world will not amount to anything. If you attempt to raise a dozen Golden Laced in a run four by six you are doomed to failure. The minute you crowd, underfeed or overfeed your birds, you will be laying the foundation for a good crop of white feathers in the wings, pale shanks and off-colored feathers in each section. Free range, of course, is best, but not really essential. Some of the best Golden Laced have ever seen were raised on a city lot, but the owner raised only a few and gave them all his facilities.

This year we were able to secure an abundance of sour milk from a nearby milk dealer, and I have never seen chicks grow so fast or so finely colored. There are no harder birds than good Golden Wyandottes. I am seldom troubled with disease or colds. A California friend wrote me, saying: "I've bred thousands of Leghorns here in California, but I have never seen such husky, vigorous birds or better layers than the Golden Wyandottes. My broilers bring a good premium over the light stock here. There are few heavy breeds around here, but there is a good sale for the Golden Laced, and I look for a great future for them."

Not Laying? It's Your Own Fault!

Hens and pullets should be laying right now.

If you're not getting a profitable egg yield from your flock it's a reasonably safe bet that you are to blame.

Probably you have not supplied *the one thing* that will help change them from loafers to layers—

Pratts Poultry Regulator

The action of its health-building ingredients is entirely natural. It invigorates the whole system—puts hens in condition to lay—aids in digesting their food—rouses and strengthens the inactive egg-organs. That means EGGS—now and all winter. Such is the testimony of thousands of poultrymen who know. Take a tip from them—make a test—we take the risk—you can't lose. Sold by Pratt Dealers everywhere on this Guarantee:—

Distinctive Qualities of the Cornish Fowl (Continued from page 1000)

Ward was of the conviction that the A. P. A. should give to the Indian Game a name that would not handicap the breed. In 1914 he asked that the entire name, "Indian Game," be dropped, and that the breed be known as Cornish, and that the varieties be called Dark Cornish, White Cornish and White Laced Red Cornish. He further requested that, in the 1915 edition of the Standard, then under revision, the Cornish be moved from the Oriental class to the English class.

The idea of making the term Indian Game obsolete struck terror into the breast of Dr. H. P. Clark of Indianapolis, whom it may be said, was the greatest authority on Games in U. S., and he pleaded before the American Poultry Association not to change the name or change the classification; Reese V. Hicks, President of the A. P. A. and Chairman of the 1915 Revision Committee, sided with Dr. Clark, and entreated the convention not to make this change, and he maintained that if the Cornish were grouped with the Orpingtons and Pouterings, they would soon be bred with long feathers.

John Ward had entrusted his side of the case to two or three members of his club and to this writer. The opposition appeared to be insurmountable, but I took the floor and maintained that the Indian Game was an English breed, and the origin of its birth entitled it to recognition in the English class; that it was a meat fowl, not a pit fowl, and the title of game was not only misleading, but a handicap to the popularity of the breed; and lastly, that the characteristic narrow, short feathering would be preserved in the English class for the Standard description of Cornish excellence would not be changed. By a vote of the Convention the name was changed to Cornish, the words "Indian Game" being dropped, and this heavy meat race was made a member of the English class. Ever since Cornish have been cooped in our shows along with Dorkings, Orpingtons and Sussex which is truly where they belong.

Merchandising a Breed

Since the publication of the 1915 Standard, the popularity of Cornish has steadily increased. Its progress appears limited only by the fact that prices are too high, the supply too limited and closely held. No one is today merchandising the breed. Many old fanciers explain vehemently that commercialism is the ruin of the fancy, but without good merchandising a breed cannot rapidly increase in popularity and too often narrows down. It was commercialism that started the Indian Game in America, it was the applied commercial sense of John Ward that revived and widened its popularity; and the breed today stands in need of more practical commercialism.

Last spring Fred H. Bohrer, New York State, who is a worthy successor of Ward as the energetic young secretary of the Cornish Club, issued a year book. It contained a number of ads of Cornish breeders. It was mailed out about the middle of April. This book was issued to "promulgate the world's greatest general purpose fowl." Its slogan was: "Cornish on every farm—the great profit breed." To put these fine sentiments to work rested with the breeders. Now, when we turn to the advertisements of those breeders we find that some said nothing about eggs for hatching, some said that they had no eggs for sale, and for the man who had five dollars in his pocket and would have liked to try a setting of eggs from this famous meat fowl, there was practically nothing offered. One breeder offered some eggs from a utility mating at \$5, and another breeder would let some eggs go at this price from his poorer pen.

This condition does not obtain in White Laced Red Cornish, the new variety of this breed which is making such splendid headway that old Dark Cornish breeders are taking notice. W. H. Card, originator of the White Laced Reds, announced in the club catalogue of 1922 that the variety is on the boom and offered eggs at \$5 per 13. Ernest B. Stanly, who has made a name for himself in a comparatively few years as a breeder of Cornish, offered eggs from his W. L. Reds at \$5 per 15. No wonder the variety is on the boom. There is an available supply of it at attractive prices. Men are carrying on commerce with the new breeder who's always timid of high prices.

There is a good deal of the mediaeval in the Cornish fancy. A number of the leaders breed for personal gratification and glory, like a potter in ancient Rome who would spend weeks in making a unique and beautiful vase for some customer's selfish pleasure. Today genius is directed in another direction. A telephone is made, not for a king, but for

twenty-million fellow countrymen; an electric light is made to drive away the fear and superstition of darkness and make bright and cheerful unnumbered homes. Likewise the poultry breeds should be commercialized to the extent of being made available to all who could enjoy them and profit by them. Any other viewpoint of the breeding proposition does not become a leader in the fancy.

Bone and Size

The Dark Cornish as a show fowl at the big shows, are a rich man's pastime if he goes in for imported birds. Some of the best Cornish come from England. Our leading breeders have to work hard to keep up and compete with the English breeders of old Cornwall. It seems as if they excel over there in producing the heavy bone, the wide spread legs, the chunky bodies, the short, hard feathering, and the substantial size which are fundamental features so much admired by all good and manly judges.

A similar condition seems to exist in the beef breeds of cattle, the Hereford, Shorthorn and Angus cattle, in which the best bone and finish is secured in the moist and equitable English climate.

One more thing favorable to England; from traveling over that country I am of the opinion that the chickens get more mineral food from the ground. Undoubtedly a study of lime, iron, etc., in their relations to poultry growing will some day be a problem to which a com-

White Laced Red Cornish pullet.

petent scientist will direct his study, and he may be repaid by opening up a field of new knowledge. A chicken doesn't simply eat grit and stones to grind its food. The fowl requires a certain amount of mineral food, exactly what or how much not being known. The addition of milk and ground bone are known to aid greatly in growth due in no small measure to their mineral content.

The tendency has been to breed more and more bone and size in Cornish. In 1905, the Standard weights were cock, 9 lbs.; cockerel, 7½ lbs.; hen, 6½ lbs.; pullet, 5½ lbs. In the 1910 Standard, the cockerel, hen and pullet weights were each increased ½ lb. In the 1915 Standard, the weights were again increased and now stand at cock, 10 lbs.; cockerel, 8 lbs.; hen, 7½ lbs.; pullet, 6 lbs.

Ten pound cocks are by no means uncommon. The big, massive, broad chested fellows, pull down the scales. The birds are heavier than they ever may appear to be. The feathering is short and the feathers are narrow. This character of plumage reduces the apparent weight of the bird, just as long, loose feathering makes a bird appear to be very large. It is the heavy bone and solid muscle of the Cornish that counts on the scales.

The Question of Fertility

The Cornish lays on meat and fat very easily and its heavy frame enables it to carry an abundance, indeed a preponderance of flesh. Perhaps it is true in all kinds of live stock that specimens that are the weaker sexually lay on flesh and fat most easily. This opinion has developed from the fact that heavy, fat specimens are slow breeders. It is true in Cornish that the very large, heavy female is a poor reproducer of eggs, and the heavy, fat male does not give good fertility. The owners of such specimens should read a page from the experience of beef cattle breeders, who also feed and fatten their animals to a point where they show that sumptuousness of condi-

POST
PAID

Now Buys the EGGETTER

For 40 Hens or Less

Delivered Fully Prepaid anywhere in the U. S. by Parcel Post for only \$6.85

This little Egg-Getter is the biggest little proposition ever made in a Vapor Bath Grain Sprouter. Our little Sprouting machine was devised by W. H. Monroe, the inventor of the first grain sprouter and is offered you by the oldest grain sprouter manufacturers in the U. S., the Close-To-Nature Company, hence you know it has got to be all right. It is 13 inches square by 28 inches high and holds 10 to 12 quarts dry grain—a capacity as large as some manufacturers rate for 100 hens. Besides making a feed that is immensely superior to that made by any lamplless. The back-lotter who has two to four dozen hens will find the little Egg-Getter highly valuable.

Made of galvanized sheet steel strengthened by a frame-work of cypress, the wood that never rots. Has 4 trays which may be divided into 4, 6 or 8 compartments as needed by means of movable partitions. Fitted complete with lamp, thermometer, partitions and directions.

For "More Eggs"

Why Waste Your Money on a lamplless (so-called) sprouter that produces the poorest grade of slow-sprouting, wiry, tough, oats, when for just a little more money you can now get a genuine vapor-bath sprouter that makes the highest grade of quickly sprouted, snappy, succulent sprouts,—the kind that the hens relish so highly that they eat great quantities of it and respond with the big increase in egg yields. Use it in any convenient place, the kitchen or dining room, or it is pretty enough to be used in the bay window with the flowers.

Let Us Mail You One Order direct from this advertisement

and your sprouter will go by insured Parcel Post as quick as the U. S. mail can take it.

Note the features of the overhang roof, absolutely rain proof; also, ventilator above the swinging window. The above is the type that Prof. Harry R. Lewis, head of the Vineland Egg Laying Contest, is equipping his new farm with, at Davisville, Rhode Island. Made in all sizes. Write for free booklet showing forty different cuts.

E. C. YOUNG CO., 6 Depot St., Randolph, Mass.

tion which it is possible to attain. But, after showing, that high condition is reduced to a status known as "breeding condition."

Very heavy cocks and hens are much improved for breeding when reduced in size and bulk. As an example: Last year I purchased a four-year-old cock at the Boston show for a breeder in the west. The bird got as far as Pittsburgh, where he was detained by the express company, and he did not reach his destination until the eleventh day after shipping. When taken from the coop he was in such a thin and weakened condition that he could hardly stand upon his legs. By careful feeding, being watchful not to overfeed, the old cock was in fine fettle within a month, and gave practically 100 per cent fertility throughout the spring breeding season. This is in line with the experience of a cattle importer, who had a very fine bull, which he was unable to sell. The bull remained in the sales barn and ran down in flesh, and was finally sold for a song. The purchaser walked that bull, fed him up after his long period of poor rations in the auction stable, and the animal became a famous sire. Such are the advantages of fasting highly conditioned specimens.

As Egg Layers

The size and bulk of the Cornish is accompanied by a temperament that is not compatible with high egg production. Moreover, the type of the Cornish includes an abdomen that tightly tucks up in the stern, and a back that narrows in decidedly from broad hips to a small stern. This type is the expression by contrast, the very opposition, to the egg type which includes a deep, full abdomen, and a width of back that is well carried out from hips to stern. In short, the Cornish has the thick pelvic bones, the small body, the yellow vent and the flat-iron shape of back which are the characteristics possessed by birds which are eliminated by those who cull flocks for "utility."

It would be better if those who cull would not use the word "utility," but would state specifically that they cull for the single purpose of increased egg yield. There is another value, meat, in which the Cornish has a superiority.

Cornish breeders are very frank to say that their birds are not great layers, just as breeders of Shorthorn, Hereford and Angus cattle say that their stock is no match for the Holstein cow. That does not prevent the beef breeds of cattle from being as popular as the dairy breeds, and as profitable for farmers working under conditions which are favorable for beef production and impossible for dairy farming.

A Cornish female will lay six to seven dozen eggs a year. That does not sound big. The owner of a Cornish flock should purchase a few White Leghorn baby chicks every other year and grow the pullets simply for their egg production value, just as the beef cattle breeder keeps a few dairy nurse cows around to supply a little extra milk. The value of the Cornish lies in their carcass. As an example of that value we quote from a letter dated Oct. 16, 1922, from W. H. Card, who lives in Connecticut:

"Am selling young Cornish cockerels for market purposes, five months old, that are averaging \$2.50 each at wholesale prices, or at 40 cents per pound live weight. Don't even have to dress them. Get 30 cents a pound for hens. Have sold near \$100 worth for market in six weeks, and at \$2.50 each it does not take such a great lot to make \$100. I never raise over 175 anyway."

Mr. Card breeds W. L. Red Cornish. This variety feathers somewhat faster than Dark Cornish, which is something of an advantage in young chickens. The carcasses also dress clean of pin feathers for the under color of the plumage is white, covering a golden yellow skin. The surface plumage is red, each feather laced with white. Tails are practically white. The chicks when hatched are of a primrose color. The first chick feathers are white. At two months the red appears with the second crop of chick feathers. At six months the true character and quality of the markings can be seen and judged.

White Laced Red Cornish were recognized as a Standard bred in 1909. Dark Cornish were recognized in 1893. There are also White Cornish, but good shaped birds are not as commonly seen in the Whites, this variety being inclined to run to longer legs, and backs that are not so wide and brawny at the shoulders.

Shoulders and Back

The breadth of shoulders is a most important character of the Cornish. This breadth is necessary in order to secure the unusual development of pectoral muscles which provide that complete covering and protection of the breast. Indeed the amount of flesh on the breast is matched by no other fowl, except

This SAMPLE INOX Makes 2 GALLONS Dip and Disinfectant

We want you to try this new and better Coal Tar Disinfectant—the only one made in solid form—

Conkey's NOX Solidified Disinfectant

Just dissolve one little cube of Conkey's Nox in a gallon of warm water and you have a gallon of Disinfecting Solution all ready for use. You pay nothing for bottles, barrels or cans; pay no freight on heavy liquid; you have no leaking or breaking.

Destroys Lice, Mites, Ticks

In combating poultry mites and similar uses, Conkey's Nox is undoubtedly the most efficient coal tar preparation known to science at the present time. It should be used constantly for cleansing and disinfecting coops, nests, roosts, incubators, brooders, fountains, etc.

Use Conkey's Nox once and you will prefer it to any other form of Disinfectant, Exterminator or Germicide. Send 10c, coin or stamps, for sample package containing 2 cubes, for making 2 gallons. Circular free.

the rare old Aseel; and the Aseel is relatively small in size compared to the Cornish.

Some may wonder how the Cornish should develop such brawny shoulders and strong breast muscles when the breed is docile, and in explanation it may be cited that in the breed there is a timid and wild nature, which shows in the young chicks which will half fear themselves when on range. The docility develops as the birds acquire more age and bulk.

The breast of the Cornish should be wide; in the cocks particularly, it should be so wide that the breast feathers, which grow in the feather tracts on either side of the breast, shall fail to meet in the middle, being incapable of entirely covering the breast, and leaving the skin over the breast bone exposed to view.

Great width of back must be carried at that point where the judge lays his hands on the bird and with his thumb and index finger spans the back from hip bone across to hip bone. Width at hip bones is a fundamental requirement for the hip is formed by the juncture of the upper part of the leg; and when the hips are wide apart the legs are wide apart.

Some breeds may be judged by their profile or side view, but a Cornish must be looked at forward in order to see the amount of spread to the legs. A bird narrow between the legs is of mediocre quality. Perhaps you have heard of Cornish men who, turning over a barrel and tying a weight to both feet of their cock birds, have ridden them on the barrel to give spread to the legs. Fanciful as the tale may be, it is this wide spread between the legs that is of great importance; and this bull-dog type is dependent upon wide hips.

Feathers on the Back

The plumage over the hips of the male should not be composed of flowing saddle feathers; rather, the feathers should be narrow and small, so that when you lift up the saddle it has a stiff, resilient quality, and springs back to a tight body covering as soon as you let go of it. A "soft" plumage is not desirable.

Softness and length of saddle feathers lead to longer, fuller tails than are wanted. The tail should be composed of firm feathers that are rather short and narrow and fold closely together. This is sometimes called a whip-tail, and the narrowing in of the bird at the stern may help to secure this tightness of tail just as the width of the Wyandotte at stern contributes to a well spread tail.

The counter part of the narrow, small feather of the Cornish male is naturally seen in the female sex. A big feather is not desirable in a Cornish female. Her plumage too, should be tight so as to conform closely to the outlines of her body.

A small back feather of this kind cannot carry to advantage an elaborate system of feather markings. The triple penciling of the Partridge Cochins weighing 8½ lbs., never works out well on a Partridge Cochins bantam hen weighing 26 ounces, for the back feather in the little bantam is too small to carry the triple penciling that is a perfected design in the larger individual feathers of the larger bird. The Cornish female, with a small feather, has a double penciling on it, which is consistent and beautiful.

In the early days of the breed many single laced birds were seen, but they are all gone from our foremost show rooms today. One of the reasons that has been cited for the decline of the Cornish boom between 1893 and 1898, is the fact that triple penciling was bred on the females, making a very dark bird, since each band of penciling is of black. Double penciling on a rich bay ground color is today the possession of the winning females.

Before discussing this color of the Dark Cornish, let us examine a little more of the shape of the bird, for in no breed in the Standard is shape a more primary and essential foundation of quality.

The plumage should be tight fitting, the shoulders wide and square, the back wide at the hips and narrowing in sharply to tail, the legs wide apart, and the body between the legs, wide, so that the male presents a most masculine and sturdy appearance. The crown of the head should be broad; a narrow, lean headed bird being faulty. The eye should be fairly well set in and pearl, approaching blue, not bay, in color.

Having gotten rid of long plumage in hackle and saddle, and secured the body type desired, there is a certain balance that adds to the symmetry of the bird which breeders too often overlook and on which they should be cautioned.

There is a tendency among some to favor a bird that is short in legs, nearly horizontal in back line and flat in breast. Such a bird may have the width and look very good to the judge. But such a specimen is not the power-

"Viking" Strain Rhode Island Whites

Just Admitted to The Standard

World's Greatest Profit Producers—Read this:

1—They LAY MORE eggs than any other breed of chickens!

Put them side by side with ANY other flock of chickens, such as Leghorns, Anconas, Plymouth Rocks, Reds, Orpingtons, Wyandottes, etc., and the Rhode Island Whites positively will lay MORE eggs than ANY of them. They are, moreover, wonderful Winter Layers, when eggs are highest in price. Rhode Island Whites are making greater average laying records in the leading contests of America than any other breed of poultry.

2—They are as good market chickens as Plymouth Rocks!

About the same weight as Plymouth Rocks, they have rich, golden yellow skin, juicy, tender meat and plenty of it—a real delicacy on the table. They command the very highest prices as Market Fowl.

3—They are beautiful, prize-winning shows birds.

Just picture to yourself, dear reader, flocks of chickens as pure white as the driven snow, with bright red heads, golden yellow beaks and legs, stylish and proud, with nice, full bodies and elegant finish. Ah! they are indeed beauties.

4—They are quick maturing, easily raised.

EASILY CONFINED IN LOW FENCES. IN FACT, HAVE MORE GOOD QUALITIES THAN ANY OTHER CHICKENS THUS FAR PRODUCED! This broad and sweeping statement is proven and backed by every well-kept flock of Rhode Island Whites in the country.

5—Very special introductory prices RIGHT NOW!

In order to introduce these Wonder Chickens as quickly as possible into many different localities, I am giving AMAZING introductory prices on first orders. Remember, THIS IS THE INTERNATIONAL HEADQUARTERS FOR THE BEST R. I. WHITES IN THE WORLD.

Investigate this wonder breed! It will surely repay you! Mail this coupon today!

No matter how long you have raised poultry, my new 96-page book will tell you things that will be worth hundreds of dollars to you. Learn how to get the best results. Read how thousands of poultry raisers have turned failure into success by following my secrets and up-to-date methods as outlined in this book.

T. E. Quisenberry

I WANT TO SEND every poultry raiser my new, free, 96-page book of money-making poultry secrets. Over 46,000 people say that I have shown them the sure way to make money. Do you know that half your flock is eating up your profits? Do you know how to tell good layers? Do you know how to make every hen pay a good dividend? My free book tells how. Simply send name for your copy TODAY!

**KIND
KEEP?**

**THE
BOARDER**

This book outlines easy methods that show you how to be sure of big egg production, regardless of weather conditions. It gives the secrets that have given Prof. Quisenberry his world-wide reputation.

Prof. Quisenberry is the founder of the Missouri State Poultry Experiment Station; Manager American Egg Laying Contest; Assistant Chief Panama Pacific Exhibition; Secretary Heart of America Poultry Show; author and lecturer. A few of the subjects outlined are shown on the opposite page. There are many others equally valuable.

This Free Book tells how Mrs. Hume made over \$2000 last year from eggs alone—how H. M. Luttrell made over \$5.00 per hen net profit—how you can make more money right today by simple, easy methods that never fail.

You Can Do As Well

Whether you have a general farm or a back-yard flock, whether you are an experienced poultry raiser or just starting, you can make big profits this year with the practical knowledge that we offer you.

200 HENS—\$1000

"By following your simple advice on feeding, housing and mating, I sold, from 200 hens and pullets, \$1,238.58 worth of eggs, baby chicks, broilers, cockerels and pullets in exactly seven months. My feed bill was \$246.89. The eggs alone amounted to \$490.32 besides 276 dozen I set in the incubator. My success is entirely due to you. I would not part with information you gave me at any price."—Mrs. Chas. Rooks, Ohio.

Feeding Methods Bring Big Egg Yield

As a result of the feeding methods you have worked out for me, I am sure getting results; in fact, from pens today (October 23, 1929), containing 600 pullets, I received 345 eggs. Very often they run more. One pen of 100 ran 73 per cent today and one around 65 per cent for the entire month. Really I am making money before I expected.—Wm. Sands, Missouri.

Over \$5.00 Per Hen Net Profit

I thought you would be interested in the record of my flock of 210 hens for the last year.

Eggs sold (2686 1-2 dozen)	\$1149.19
Chicks sold	217.38
Chickens used at home (70)	35.00
Increase in flock (138 pullets)	207.00
Total income	\$1608.57
Cost of Feed	606.72
Net Profit	\$1001.85

Wipe Out Every Rat and Mouse

Amazing Discovery Quickly Kills Them All—Not a Poison

Rats, Mice, Gophers,—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. The original, time-tested Danyz, fluid true Virus. Entirely harmless to humans, poultry, stocks, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside, hunting air and water. Imperial Virus is put up in sealed bottles, guaranteed to retain full strength and potency. Only safe and sanitary method to overcome these pests. Indorsed by more than 60,000 users, including Farm Bureau Experts, numerous factories and large, nationally known institutions.

YOU CAN GET YOURS FREE

Send no money—just your name and address, to Imperial Laboratories, Dept. 1041, Kansas City, Mo., and they will send you by return mail two regular full-sized \$1.00 bottles of Imperial Virus (double strength). Pay the postman only \$1.00 and a few cents postage when the package containing the two bottles arrives. Use one to rid your place of the pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

Note—Readers risk no money in accepting the above offer, as Imperial Laboratories are fully responsible, and on your request will refund your \$1.00 any time within 30 days, if you are not entirely satisfied with the results.

304 S. 6th St., Marshall, Ill.

LAST WINTER HIS FGG YIELD INCREASED 40%

"I purchased one of your (Little Putnam) Stoves to heat water, as you advertise," writes Patrolman John Skeurs, of the Detroit Police Dept. "Last winter, my egg yield increased 40 per cent. and chickens were in better health than ever. They sure are wonders; I only used 6 pints of oil, all winter. Father said, 'You must be feeding your chickens loads of salt, the way they go after the water!'"

Get a Little Putnam Stove at your dealer's. Or, if he doesn't carry it, send \$2.00 to I. Putnam, Route 1105-R, Elmira, N. Y., and one will be shipped prepaid.—Adv.

ful, coat-of-mail Cornish that the Standard calls for.

In the first place, the legs should not be extremely short. A cockerel very short in legs will not attain the greatest size and weight when mature.

The legs should be moderately short, emphasis being laid on heavy bone in shanks and thick, heavily muscled drum sticks.

The back should be higher at the shoulders and decline downward to tail. Alfred Birch of England writes in the 1922 Feathered World Year Book: "Too many of the present day Indian Game dip too much forward, and as I once heard a fancier describe the ideal bird: 'It should allow the rain to run off its back and not run from its tail to its neck.'"

The breast of the Meal Cornish is not flat, but should be well rounded and project beyond the wings.

Moderate length of legs, so placed as to secure the proper back carriage, and accompanied by the full, well rounded breast, give us the last word in good Cornish-type. Such a bird is not a squatty dumb-bell, but a powerful, forceful, impressive specimen, with the shield and coat-of-mail of a crusader, and anything short of that powerful yet agile built is deficient.

Nor should great size be allowed to overbalance the agility and the armor of the crusader type of Cornish knight. In the words of W. S. Templeton: "While large size is commendable, muscular strength, graceful activity and symmetrical type should not be sacrificed for abnormally heavy bone and sluggish bulk."

Dr. H. P. Clark voices the same opinion in a new book, "The Cornish Fowl," by Fred H. Bohrer, secretary of the Cornish Club. Dr. Clark in a preface to Mr. Bohrer's splendid work, says:

"If we follow our slogan, 'Cornish on Every Farm,' we must produce such Cornish as will be able to take care of themselves on a farm. Not the listless waddling fourteen pounder, but a bird of some sprightliness and ability to hustle. One that can go after a grasshopper and catch him. It seems to me that present Standard weights are better than heavier ones would be, both for the egg basket and also for the general popularity of the fowl. Even in a 'beef breed,' quality should be considered before quantity."

The Low Set Battle-Ship Type

Writing to us on Cornish type, Mr. Templeton than whom no one in America has given more thorough study to the subject, says in a letter dated Aug. 1, 1922:

"The 'duck-legged' Cornish are not my kind. We don't want those low, weak birds that have their knee joints between the upper and lower thighs crouched up under the shoulders or wings in a crampy manner. Nor do we want their accompaniments in the form of short, shallow bodies and sterns that do not possess capacity. Good, strong, straight legs of medium length under a strong back and a body that is long, broad and deep should enable us to develop the best that is possible in the breed."

The faddists have had quite a long day of it with duck-legged, squatty birds, horizontal in the back and flat in the chest. Perhaps they were not so much to blame since the 1915 Standard called for "low carriage" in Cornish, but that phrase has been stricken out and will not appear in the 1923 edition.

Some years ago there was real need of writing into the Standard the requirement that Cornish should have a low carriage, in order to impress breeders and judges with the desirability of favoring a bird of compact form, and disfavoring the stilty, reachy type. When shortness of leg becomes a hobby which is exaggerated to such an extent that the fault of bow legs is tolerated, it is as much to be condemned as long legs that are inkneked, that is, knock-kneed at the hock joints.

It used to be that show critics in writing up the best English shows would refer to the winning Cornish as having "capital heads and sound feet." Those are good qualities. The bird should have a strong skull, but many an English imported bird today has a loose, comb the rear of which flops. And, feet! There are cocks pounding around on stubs! The Cornish cock should have an easy yet powerful step. Crooked middle toes, or hind toes that incline forward and pass under the name of duck-toed, are today passed by judges for mere size or bulk.

Color of Cornish

The White Cornish should have a pure white plumage, although brass in cocks is a prevalent fault. The White Laced Red variety has a color combination possessed by no other fowl. The Dark variety possesses a lustrous brilliancy of deep color.

The Dark Cornish female has a rich bay ground color that approaches mahogany. This feather is laced around its edges by a narrow

band of lustrous greenish black. Within the enclosed mahogany center there is one distinct penciling of black. This feather marking is sometimes referred to as double lacing, and sometimes as double penciling.

Single lacing or triple penciling are not desirable (although on some of the largest feathers such as tail coverts there is a tendency to the triple marking, while the smallest feathers, such as those on the fronts of the wing, are practically single laced).

The males used to produce the mahogany ground color and crescentic lacings are not always the black birds which seem to receive the preference at times in the show room. The best pullet breeders are frequently broken more with red. Especially is this true when you open up the plumage. For instance, the hackle feather from a male, shown in the upper left hand corner of the feather chart, appears nearly black on the surface of the bird because the feathers of the neck overlap one another, but when you run your fingers into that neck plumage and open it up, you find a red shaft and a patch of red in the lower part of feather. The same is true of the saddle feathers, (lower center of the feather chart).

The wing bow of the male, lower left hand corner of feather chart, is an important section in determining the value of the bird as a producer of rich colored pullets. Here you note a pronounced red center in a greenish black feather.

Some will say that these male feathers show a bit too much red. The cock that they are from won first at Philadelphia, 1920, and Mr. Bohrer writes: "This bird has bred some good stock; personally, I like to see them show a bit of red."

It should interest Cornish men to know that the hackle and saddle feathers from this cock which are illustrated, plucked July 25th when they were fully out, measure exactly 3 inches in length, and show a quarter inch of white at base next to skin. At show time, a good saddle feather will measure about 2 3/4 inches long, as the plumage in January is seldom fully grown after the molt.

A saddle feather no longer than 3 inches was not possessed by the White Cornish cock shown on the first page of this article. His flowing saddle hangs below his wings and tail—but the Whites are frequently too soft and long feathered.

It is common to find broken wing flights in Cornish cocks, due possibly to the prevalence of white which the exhibitor preferred to remove, yet suspicion is not wholly justifiable for those big cocks with broad shoulders do insist on battering up their wing primaries.

Pullet Eggs

I have read so many articles in poultry journals explaining why pullet eggs do not hatch as well as hen eggs; that Winter eggs are not so fertile as Spring eggs, etc., that I thought I would give you the record of a hatch I have just taken off.

On January 29 I set 61 eggs in a small incubator. On the eighth day they were tested and two removed as being infertile, leaving 59 eggs in the machine.

On February 19 I took out 58 fine chicks, the one remaining egg containing a full grown chick, but dead in the shell. This in itself may not be so wonderful for a February hatch, but when considered in the light of all the facts in the case, I believe it upsets a lot of theory we so often read about. For instance, it is often stated that eggs which have been chilled are not likely to hatch. These eggs were in process of collection from January 14 to January 29, during which time the temperature was often below freezing. All the eggs were gathered after dark in the evening, from open nests in an open-front house, and to the touch certainly felt like they might be frozen. They were kept in open trays in a cellar where the temperature varied from 50 to 70 degrees.

Now, as to the inadvisability of setting pullet eggs. One-half of the eggs in this hatch were from pullets hatched in March and April of the previous year, one-fourth from pullets hatched about May 15, and the other one-fourth were from year-old hens. These pullets were mated to cockerels from the same hatches, two of them having been hatched on May 15.

The writer is a rank amateur, operating on a back lot in spare moments, and from this record I have deduced the following:

That eggs will hatch even though they have been subjected to freezing temperature; That it is not necessary to provide a low even temperature to preserve the hatching quality of eggs being accumulated;

That eggs from pullets mated to cockerels, even though as young as eight months, will hatch, and

O. E. FOULK.

"No Lice on Me!"

The U. S. Dept. of Agriculture has solved the lice problem for you. Bulletin 801 says that after numerous tests with many kinds of material, nothing proved so effective as

Sodium Fluorid

Write to us for a copy of this interesting, helpful Gov't. Bulletin. We will gladly mail you one free. It tells how you can easily, quickly and permanently get rid of lice on your poultry.

Southern Agriculturist, a leading farm paper, says: "Sodium Fluorid is the only lice remedy that will kill all kinds of lice."

Clemson Agri. College, So. Car., says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried." Over twenty other State Exp. Stations say the same.

R. T. Parkhurst, Head Dpt. Poultry Husbandry, Idaho Agri. Exp. Sta., says: "It (Ivo-San Sodium Fluorid) is a very satisfactory control measure for lice. For the price, I consider your product superior to any I have handled."

"I used Sodium Fluorid on my chickens 3 years ago and haven't had a louse on them since." (Andrew Small, Rock Springs, Wyo.)

IVO-SAN SODIUM FLUORID

is the best brand, being air-floated, fine as flour, unadulterated and all active. Use it dry or dissolved in water as a dip. Costs only 1/2 cent per fowl.

Also kills cockroaches, ants, waterbugs, lice on animals and plants. Two lb. can, \$1; 4 lb. can, \$1.75; 8 lb. can, \$3. Postage prepaid. Points outside the U. S., 10 cents per lb. additional.

Send today for your Ivo-San Sodium Fluorid; get rid of lice for all time and give your poultry a chance to increase your profits.

NU-LIFE FOR CHICKS

Thousands of winners in last season's shows were aided from shell show-room by NU-LIFE.

NU-LIFE TONIC (Powder Form)

Prevents and cures Bowel trouble in baby chicks, quickly restores stunted chicks back to a healthy growth and is unequalled as a tonic for adult fowls or turkeys.

NU-LIFE PILLS

Endorsed by America's Leading Fanciers as the best remedy on the market for Going Light, Bowel Trouble, Roup, or any run down condition of Poultry, Pigeons or Turkeys.

NU-LIFE Pills and NU-LIFE Tonic are both packed in two sizes, 30c and \$1.00, for sale at your dealer's or sent postpaid at above prices. NU-LIFE REMEDIES must please you. If for any reason you are not satisfied, your money will be refunded. Write for descriptive circular and list of satisfied customers. Agents wanted. Ask for dealer's prices. NU-LIFE COMPANY Box 444-C ZANESVILLE, OHIO

"DANDY" BONE CUTTER Only \$5.00 Down CLOVER CUTTERS, FEED AND GRAIN MILLS FOUR MONTHS TO PAY

Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood and feathers. Write for our free booklet and easy payment plan. We also sell on 15 days trial, no money in advance. The "Dandy" costs less than most bone-cutters and it works infinitely better. To insure big sales this year we have made special reductions in prices. Don't delay. Write now.

Black Javas

Editor A. P. J.: I have read with interest the article in your September issue on Black Javas by my friend, Robie Whitney, of Maine, and concur in all that he has said of this grand old thoroughbred fowl. The gist of the matter is that a Black Java is no more a Jersey Giant than an American Dominique is a Barred Plymouth Rock. Being of the same or nearly the same color does not make two breeds identical. They may differ widely in every other important particular.

The Black Java is a thoroughbred, the Giant and the Rock are made breeds; that is, they are the result of crosses. The Black Java was introduced in this country about 1835, by an old sea captain named Scoville, or Schofield, who made voyages from New England to the East Indies, and on his return from one of these voyages brought some Black Java fowls and presented them to a life-long friend, Amasa Converse, of Massachusetts, who in turn gave some of the breed to his niece, Miss Lucy Converse, who afterward became Mrs. Lyman J. Tower, and was the grandmother of J. Lyman Kelly, of Malone, N. Y., who spent his boyhood days with her and assisted her in caring for her Black Javas, which, he says, were identical with the best Black Javas of today, and nothing like Black Cochins, as some have claimed.

Mr. Kelly is a poultry fancier of acknowledged ability. I am also of the same opinion as Mr. Whitney that the Black Javas have for several years past been gaining in popular favor.

The fact that a great number of Black Giants were shown (mostly by a few big breeders) at Madison Square Garden, while few Black Javas were exhibited there, signifies little: for the men and women who are now taking up and breeding Black Javas are either quiet country folk who value the breed for its useful qualities, or more wealthy people who have become interested in them by reading the articles that have recently appeared in farm and poultry papers. Few of either class will exhibit at the poultry shows.

I have been breeding Black Javas for quite a number of years, keeping about 20 or 25 good Java hens, and advertising in a small way, and, like Mr. Whitney, I cannot fill the orders for eggs that come to me each spring. Last spring I was obliged to return many dollars sent for eggs I could not supply. Now, in conclusion, let me re-

peat with Mr. Whitney: Let us keep the two breeds, Black Giants and Black Javas, entirely distinct, in our minds and in our interests. They are no more to each other than American Dominiques are to Barred Plymouth Rocks or Black Breasted Red Games are to Brown Leghorns.

W. H. HARWOOD, M. D.

New York State.

Washing Fowls for Exhibition

Washing fowls is a task which no one enjoys, but since it is almost impossible for a white fowl to win a prize in the showroom, regardless of its superior qualities, without having first been given a thorough cleansing, it behooves everyone who contemplates exhibiting white birds to see that they are properly washed before being placed on exhibition.

Various methods are employed in washing fowls, some conditioners using three tubs for water, others four, and still others five. If the birds have reasonably clean yards and houses in which to run, three waters will be sufficient. Tub number one contains the wash water and in the other two tubs is the rinse water.

There should be a heated stove in the room where the washing is done, and the temperature of the room should be warm enough for one to feel comfortable in his shirt-sleeves.

Place the tubs in a row on a bench or boxes sufficiently high to enable the person doing the work to stand in a comfortable position and fill them about two-thirds full of soft water which has been heated to a temperature of about 103 degrees fahrenheit, always being sure that the rinse and the wash water are the same temperature. Some conditioners advise having the rinse water much cooler than the wash water, but to remove a bird from a tub of warm water to water that is several degrees cooler is likely to produce a chill, followed by a severe cold.

The use of a first-class soap is required in washing fowls, and there is, perhaps, no better soap for this purpose than castile. About one and one-half bars of the soap should be reduced to a liquid state, by being boiled in a little water, and then thoroughly mixed with the water in which the fowls are to be washed. This is a much better method of using the soap than applying it directly to the fowl's plumage, as it eliminates the possibility of the feathers becoming gummed with soap.

When ready to begin washing, gather up

the bird, letting its body rest on the forearm and palm of one hand, with its legs extending slightly out behind, and with the other hand on its back slowly immerse it in the water, all except its head. Gently raise and lower the bird until the plumage is thoroughly soaked, then with sponge and soft-bristled brush give it a good scrubbing, always rubbing with the feathers and not against them.

Use the sponge to clean the head appendages, and the small end of a toothpick to remove the foreign matter from under the scales of the shanks, being careful to not break or otherwise injure the scales.

When the fowl presents a clean appearance, place a board which is about three inches in width across the top of the tub, with the ends extending through the handles of the tub to prevent it from slipping, and stand the bird on this and pass the hands over it from head to tail, gently pressing and rubbing the water from the feathers.

Transfer the bird to tub number two, rinse the soap from the sponge and the brush, and proceed to wash as much of the soap from the feathers as possible. Next place the bird in the final rinse water and give it a thorough rinsing. Raise and lower the bird in the water; also pour the water over it, being sure to get every particle of the soap out of the plumage.

Again stand the bird on the board and rub the water from the feathers with the hands, also use a sponge and bath towels to take up the water, and then put the bird in a coop to dry.

The drying coop should have a slat bottom, and should be large enough to permit the bird to walk about and shake and preen itself, as it can do much in this way to hasten the drying of the plumage in a natural way. Place the coop just close enough to the fire for the birds to be comfortable, and as they become dry gradually move them back.

Should a bird faint while being washed, pour cold water on its head to revive it. But fainting will seldom occur unless the water in which the fowls are being washed is too hot, or the bird has a weak constitution.

When the birds are all dry and ready to be returned to the roosting pen or conditioning coops, throw a blanket or other covering over the coop in which they are to be transferred to prevent the wind from blowing directly on them.

See that the quarters in which fowls are placed after being washed are clean, free from drafts and bedded with clean straw.

Missouri.

John Miller.

OWEN'S FIRST PRIZE OLD PEN COCKS CHICAGO NATIONAL SHOW JAN. 1922 Address VINEYARD HAVEN MASS.

The Alert Blue Andalusian

A true slogan adopted by the Blue Andalusian Club of America, as descriptive of this grand old breed, as only those know who have bred them. One of the oldest fowls in existence, containing the purest blood, from from crosses, hence, used extensively in research work of the colleges.

Are they not a thing of beauty? Consider for a moment, dear reader, at the type and carriage of this bird. Graceful alertness is plainly depicted, and then let us take in the plumage, two contrasting shades of blue with distinct lacing. A chicken to be proud of from the neat five-pointed, erect red comb to the slaty legs and well placed feet. And furthermore my friends they grow this way. The female also is a handsome specimen. An even shade of medium blue with the sharp lacing all over, extending right down to the shanks. The neck of the female runs a trifle darker blue, due to the hackle feathers carrying a wider lacing. A neat lopped comb, large red eye, and pure white ear lobe completes the picture.

The standard weight of this breed calls for cock six and one-half pounds, hen five and one-half pounds, cockerel five and one-half pounds and pullet four and one-half pounds. However, I find that the call for larger Andalusians is most insistent and think myself that it improves their appearance. By this I do not mean coarse, gawky birds, but ones that are neat and shapely. I believe that the Standard Revision Committee did right in recommending an increase of one-half pound to both sexes.

Of course their stronghold is the heavy production of big white eggs, the kind that are always in demand for the fancy trade and which bring the highest prices. They are unexcelled as winter layers. I keep my flock in open front houses in a climate that is very changeable, running as cold as twenty degrees below zero. They are always healthy and vigorous and I have but little trouble with colds or frozen combs. They shell eggs out in the coldest weather and keep right on the job right up to molting time. The shells of their eggs are firm and smooth and stand shipment well.

The Andalusian is also a good meat fowl, and the young birds make good broilers, having a firm, plump white carcass. They certainly make fine roasters even though they do not grow to as large size as some other breeds. The flesh is tender, possessing a slight gamey flavor.

They hatch well, ranking with the other Mediterranean fowls. The chicks are very active and are great foragers, their little fluffy grayish blue bodies making a pretty sight. Maturing at an early age the pullets begin laying at from five and a half to seven months, producing larger eggs than one would expect from young pullets.

There is one peculiarity about this breed which I think should be explained and that is that they do not breed true to color. Of course this is true with practically every kind of chickens, but perhaps it is a little more noticeable in the Andalusians. The chicks hatch about fifty per cent blue, the remainder being divided about equally between black chicks, or white chicks with black splashed feathers. These are commonly called "sports" and are just as good for laying or for the table as the all blue chicks. In fact I think that one advantage is that one can kill them for broilers and not have to question whether or not he is killing a show bird, as sometimes a chick will turn out to be a wonder when he looks worthless at the age of ten or twelve weeks. Many also mate these sports together, getting all blue chicks. Have never tried this mating but when a man sells you eggs that produce 100 per cent blue chicks, he is probably crossing the black and white sports. With 50 per cent blue chickens you will get as many good chickens as other varieties produce and have less trouble culling.

So when we have summed up the qualities of this old breed we are quite sure to find that the apparent drawback of off colored chicks is not only met but is offset by their sterling qualities of egg production and beauty. I wish it was possible for me to interest more people in Andalusians, and that is what I have endeavored to do in this article. So often we pick up a poultry magazine telling about different breeds but not very often do we read anything about Andalusians. This article was really written in response to the request of a reader of this magazine some months ago.

In closing would impress the importance of pushing this breed more to the front, by showing them in larger numbers and better quality, and also by advertising.

Roy E. Barnard.

CANNED SMOKE

"SMOKE 'EM," THE GUARANTEED ROUP CURE.

A discovery of the world's best known home of Registered Livestock and Trapnested Leghorns. The loss of thousands of dollars worth of our valuable fowls each year from roup, colds, canker, diptheria, and chicken-pox either meant the discontinuation of our poultry department or to discover a genuine cure. Now our losses have absolutely discontinued. Over two hundred thousand poultrymen and farmers throughout the United States and Canada use and recommend "SMOKE 'EM," the most scientific DRUG-LESS CURE that ever has been discovered. Inexpensive and easy to use. Eliminates the slow method of vaccination and injections of serums as preventives. Every cent of your money back if it fails. Used extensively in California where every remedy is analyzed and closely scrutinized by the State Board of Health. Any remedy or preparation used in California must have genuine merits. Two hundred thousand testimonials on file at our office.

Read what, I. Polley, of Baker, Oregon, says: "I used 'SMOKE 'EM' on a number of chickens whose eyes were swollen shut, mouth full of canker and they had that terrible roup odor, on the third day they began to improve and drink water, the fourth day they began to eat and on the seventh day they began to sing and lay. I surely cured them with 'SMOKE 'EM,' your genuine cure for roup, and we will never be without it."

W. E. Jackson, Berryville, Virginia, writes: "The 'SMOKE 'EM' I bought of you last fall certainly did the work, it is the best thing I have ever seen for Roup and Colds in poultry. My birds were in such a condition that I thought I would never get them well, but, after smoking them with 'SMOKE 'EM' they came around alright. Thanking you for putting such a cure on the market."

Emil Seib, Poseyville, Indiana, R. R. No. 2, writes: "I want to let you know about our chickens. They had been sick a few months ago, and we thought half of the flock would die. Eight of them died within a few hours. So we gave our chickens a good dose of 'SMOKE 'EM' in the morning, and the next morning they were alright. So I don't think anything else could have cured them quicker and better than your 'SMOKE 'EM'."

E. T. O'Neal, Secretary, Board of Education, District 7, Hurst-Bush School, Hurst, Illinois, writes us: "I tried 'SMOKE 'EM' last year and find it a better success than anything I ever tried. I had come to the conclusion there was no positive cure for roup, but 'SMOKE 'EM' will do the business."

T. A. Hall, Milford, Delaware, writes: "I have been advised by a friend of mine, Mr. Edward Passwaters, Hartley, Delaware, to try your roup remedy, 'SMOKE 'EM,' canned smoke, as 'SMOKE 'EM' cured Mr. Passwaters' fowls. The State furnished me with serum for vaccination and it is not checked yet, and as I have a very bad case of roup will appreciate your sending me 'SMOKE 'EM' at once, as I have faith in it."

You owe it to yourself and to your poultry to write or wire for our large catalog and full information today. The price is low. Dealers, we have a good proposition to offer you.

THURMONT, MD.

BROOD YOUR CHICKS 30 DAYS FREE

Don't miss this opportunity. Brood chicks during cold weather without loss or trouble. Use Simplex Brooder Stove. A wonder for simplicity, dependability and success. It is different. Better. Safe and sure. Chicks thrive under its radiant heat. No hovers to bother with. No Gas. No fumes, No wicks. No smoke. Self regulating. Saves worry, bother, work, time and money. Successfully raises 20 to 50 per cent more chicks. Ventilates as it heats. No more deaths from white diarrhoea or poor ventilation. Chicks always healthy and hardy. It's the brooder you have been looking for.

30 Days Trial!

Judge the Simplex Brooder Stove yourself. See what splendid success you'll have. You run no risks. If it doesn't fulfill absolutely every claim we make for it, return at our expense and we refund money in full. We know you'll like the Simplex. One trial will convince you of its superiority and dependability. Thousands use it.

TURN LOSS INTO PROFITS

Simplex soon pays for itself in economical operation and additional chicks raised. "Is a perfect jewel!" says Miss Ada Klotz, Mc. "Have used for seven years with perfect results" writes Jonal Mills, Ind. Have used several makes, but Simplex beats them all!" according to Senger & Parshall, N. Y. Many other similar testimonials. Write for fully illustrated booklet. Mailed to you FREE. Send for it tonight. Learn about free trial offer Address

SIMPLEX BROODER STOVE CO.
P. O. Box 3011 Grand Rapids, Mich.

Simplex stove made in three sizes. Capacity 200-500-1500 chicks

Gives chicks even temperature, plenty of fresh air, large radiation area. Gives ample room for exercise.

Everlay Leghorns

The Famous EVERLAY Strain of Brown Leghorns hold a World's Record made at the American Egg Contest. Hundreds of enthusiastic customers have found them just what they so much desire, great layers, less feed, so hardy, active and clean on city lot or farm. They have won at all the big shows and will win for you. Just write your needs. Catalog upon request. Bargains in cockerels for show or flock.

Black Wyandottes

By G. B. Price, Jr.

Picture a bird of curving lines from head to foot, with neat comb conforming closely to the shape of the head, short stout beak shaded with yellow, reddish bay eye, yellow or dusky yellow shanks, with plumage of lustrous greenish black and you have before you an ideal Black Wyandotte.

To the man who wants recreation from business affairs and who would like to breed a variety of poultry a much better breed than Black Wyandotte can not be found. They will look clean even when kept in a dirty, smoky, city back yard, and also it is not necessary to spend days washing and laundering them before making a show. To the man who wants a plump broiler, a good roaster or a good layer the Black Wyandotte ranks with the best as they have that rich yellow skin demanded on the market.

As a utility fowl the Black Wyandotte, like all other varieties of Wyandotte, is in the A-1 class. Being hardy of constitution and breeding true in a reproductive capacity for exhibition purposes, they possess practically all the qualities of a superior general purpose fowl. Now that black plumage fowl are becoming more and more popular in this country the intrinsic productive qualities of Black Wyandottes should make them a most profitable fowl for the commercial poultry keeper and the farmer, which would result in a well deserved popularity in the utility poultry field.

The Wyandottes have always held their own as layers and the Blacks are no exception in this respect. Of course, egg production is largely a matter of strain rather than breed and quite a number of Black breeders are breeding both for egg production and beauty but I would like to see all our breeders work for both as some of our worthy varieties are now nearly extinct because they were bred for the fancy alone.

The early Silver Wyandottes were made up of several breeds to an extent that out of the variety came both black and white sports. Black Wyandottes originated in 1884 or 1885 as sports in the yards of two Ohio Silver Wyandotte breeders, namely, Messrs. F. M. Clemens and F. J. Marshall and by selective breeding these men developed the Black Wyandotte. It is claimed that C. H. Akerley, New York, started to breed them about the same time. Mr. Marshall bred them for seven years while Mr. Clemens continued to breed them for a quarter of a century, disposing of his stock in 1910 to the late Frank C. Stiles.

The Black Wyandottes were admitted to the Standard of Perfection in 1893 and ap-

peared in the edition of 1894. The variety was permitted to have black shanks, the disqualifications for them being "Shanks other than black shading to willow or yellow; bottoms of feet other than yellow, pure white in any part of plumage extending over half an inch; two or more feathers tipped with white."

Breeders who thought it best to have the same yellow shanks and feet as other Wyandottes did much to injure this variety for several years. It was finally settled that it was impossible to have the yellow shanks and feet with good black surface and under-color. This information, gained by bitter experience, resulted in establishing dark color for beak, shanks and feet.

Under this natural Standard, the variety was successfully carried along, and its progress in color and type kept pace with that of the other varieties of the Wyandotte breed, as was illustrated at the Cleveland show, 1910, when the first prize Black Wyandotte cockerel was awarded the American Poultry Association special for the best bird in the American class in which competed all Wyandottes belonging to A. P. A. members.

At the Palace Show, New York City, 1912, the class of Black Wyandottes consisted of 55 specimens in competition. The Black Wyandotte became very popular in England, a real "boom" starting in 1906, and at the Crystal Palace Show, 1908, 140 Black Wyandottes were exhibited. Therefore the popularity of the Black Wyandotte in England

cannot be overlooked or questioned. The English were breeding a fine yellow leg, a yellow beak and a bright bay eye; but their Standard, instead of calling for a black under-color, laid stress on the beetle green sheen of the surface and asked for an "under-color as dark as possible." In England the birds are judged very much as they stand in their cages, and are not taken out and examined closely as in American shows. A bird in the English shows that fails slightly in under-color may still be pronounced "very good."

The popularity of the Black Wyandotte in England and the Yellow Leg of the English Standard had an influence in America. A change was near at hand and with the publication of the 1915 Standard a new color-type was demanded. The Standard Revision Committee argued that reddish-bay eyes and yellow shanks are breed characteristics of the Wyandotte; therefore all varieties should conform to these distinguishing features of the breed. Therefore the present Standard was drawn up which reads as follows:

"Beak—Black, shaded with yellow.

"Eyes—Reddish bay.

"Shanks and toes—Yellow or dusky yellow.

"Plumage—Lustrous greenish black. Under-color—slate."

The American Black Wyandotte Club was the first club organized for the betterment of the breed. This club died out about twelve (12) years ago. Soon after the International Black Wyandotte Club was organized with Dr. Bristol as Secretary, George Weed as President and Bradley Cook as Vice-president. When the Standard was changed to yellow legs most of the members dropped out again.

In March 1921, the National Black Wyandotte Club was organized. The present officers are: Bradley Cook, Pa., Secretary and Treasurer; C. H. Nesbitt, N. Y., President, and Roy D. Brown, Va., Vice-president.

The leg color question has done more to injure the advancement of Black Wyandottes than any other thing.

Always use a male with yellow legs at the head of your yards if you expect to accomplish any thing worth while in yellow legs on your females, for a dark legged male, even when mated to females with yellow legs, will not produce any pullets and only a few cockerels with yellow legs.

What we want is to get legs as yellow as we can but don't sacrifice your good size and type, too quickly in the rush. Use females of good size and type as we get type and size in our young stock from the

Good style in a Black Wyandotte female.

female side and color and head points from the male's side.

If your females are dark in legs, mate them to a male with golden yellow legs, and if he is light in under color it is all the better when mated to dark leg females.

When your females' legs are yellow you can mate them to a male with yellow legs and dark as it is possible to get him in undercolor, which, of course, does not mean black undercolor.

It is a great deal easier to get yellow legs on your males than it is on females. Be sure to always use strong fully developed birds of good size and type, in mating up your yards, for type makes the breed, color the variety.

Breeders sometimes find the type of the primary feathers white in their best specimens. Sometimes this may be overcome by mating females with this defect to a male with solid black wings.

Few if any American Black Wyandotte breeders double mate. Bradley Cooks writes, "Regarding double mating I would say I mate so that I produce both sex for exhibition from a single pen. I don't think it necessary to double mate for Black Wyandottes and don't know of any breeders that do."

The purple barring on Black Wyandottes is a serious although common defect, and it is penalized, when the bird is judged, from one half to two points in each section where found. The purple has been said to be due to an excess of green color pigment. Now it is known that purple barring comes more from improper care and feeding than from the mating.

Wyandotte size and type first, then yellow or dusky yellow legs as any one will admit that the beautiful Blacks are all the more beautiful if finished off with a pair of yellow or dusky yellow legs.

Now is the time for all Black Wyandotte breeders to wake up and work together for the good of our variety.

Swat the Mites

If you are a beginner at poultry raising and do not know the appearance or work of mites, just get these facts in mind:

The mite is the small louse that sucks the blood from the fowls when they are on the roosts at night. It does not stay on the body of the fowl, but retires to the darkest corner of the henhouse within three feet of its nightly labors at farthest, and three inches is the usual distance if a hiding place can be found so conveniently.

To catch the mite you must pay no attention to the fowl, but you must concentrate all your activity on the henhouse, and more especially on the roosts. Go through the houses in the strong sunlight and carefully examine the perches, lifting them up from supports. You will see a dark, reddish blotch, perhaps powdered over with a sort of light, flowery substance.

Get a can of kerosene or commercial lice paint and carefully flood this place with the oil. There will be a scattering, a spreading out of that dusky red color. You have found a colony of mites and they are gorged with the blood of your chickens, sucked from them the previous night.

Now, take a whitewash brush and a generous sized can of kerosene or commercial liquid lice paint, which is usually stronger than kerosene, and go to work. Paint every perch, fastening support and the nearby walls thoroughly with the oil, soaking it into the cracks and not skimping in the amount used. If the walls and perches have been previously whitewashed, look for scales in the coats of the whitewash, and if you find them, carefully pull some of them off. If you see the red color again, you have only unearthed more homes of mites.

In one of my earlier experiences I agreed that the death of any half-grown pullet could not have been caused by mites, for my henhouse had been whitewashed with many coats of the death-dealing lime. By suggestion, I investigated this whitewash and found every scale the home of a thriving colony of the troublesome mite. I immediately donned old clothes and with an old hoe went to work scraping the walls, and it was only by scraping them thoroughly and soaking them with kerosene that I was able to exterminate those mites. I now have complete control of the mites. I go over the seams and supports every two weeks, without fail, in Summer. After you get control of the mites it is not necessary to paint the perches with the oil more than twice a year.

Do not weaken your flock and perhaps lose some of your half-grown chicks before you try to find out if there are mites in the henhouse.

LOUISA HAMLET.

Illinois.

MORRIS WHITE ORPINGTONS

THE "PROVEN LEADERS" AS A COMBINED EXHIBITION EGG-LAYING STRAIN ARE AGAIN LEADING WINNERS AT NEW YORK STATE FAIR, SYRACUSE, September 12, 1922.

At America's greatest early exhibition in a midwinter class of quality and numbers, the "Proven Leaders" again assert their right to superiority over their competitors by winning under Judge Richard Oke.

OSAGE, IOWA

A Back Yard Flock

Nearly all of the articles on advice to back lotters I have read in the three poultry journals, which I take tell us (I am a back-lotter myself) how to make the hens lay. But after we have made the hens lay and start getting more than enough eggs for our own use and what few our neighbors want, what then? We don't like to start out and peddle them, we don't want to keep them until we get a case and then ship them, for they might be getting pretty light by that time.

A back-lotter is usually a man that is working a regular job and keeping a few chickens on the side, more for recreation than anything else. He doesn't like to go out and solicit orders for eggs, still he wants to sell what extra eggs he has to help pay the feed bills. This is what happened in my case.

my chicken coop and the nests and the feeding appliances and all the time I was talking cleanliness.

I have not solicited an order for eggs or chickens since I started keeping chickens a year ago, and I am now getting from five to six dozen eggs a day from 100 S. C. W. Leghorn pullets, and there is not a day goes by that I don't have to turn down an order for eggs, because I don't get enough and at that, I am getting from 5 cents to 10 cents per dozen more than the peddlers are selling them for.

My wife collects the eggs and every one of them has to pass her inspection before it is ready for delivery. You might think that this don't pay, but let me tell you an incident that happened a few days ago. I go to work at 4 P. M., and on that day I had about seven dozen eggs for delivery all in dozen containers, except two dozen which were in a small bucket with a clean, white cloth in the bottom and around the sides.

First prize White Plymouth Rock cockerel at Indiana State Fair. Owned by U. R. Fishel, Box A, Hope, Ind.

On day while cleaning up my chicken run the doctor in our small town, riding by on his horse, stopped and said to me: "I don't know anything about the chicken business, but I like chickens and eggs to eat and I know I would enjoy them much more coming from a place as clean as that is." About a week later he came to me and asked me if I would supply the hospital with chickens and eggs. This I have been doing ever since and getting more for my eggs and chickens than what the market was and is selling them for.

This gave me an idea. If a doctor, who usually is more particular than any one else about everything being clean and sanitary, and this one I know is, would want my poultry products because my chicken yard was so clean, why couldn't I make other people want them and ask for them.

With this idea in mind every time I heard a passerby remark on what pretty, clean chickens I had I invited them in to inspect

I set this bucket down on the desk and one of the eight or ten men in the office looked at them and called the rest of them to look at them.

Right there I had to turn down two or three of them for new customers. Those eggs were just common eggs. Why did the looks of them make them want to get eggs from me? Not because they were any better eggs than what they could buy from the peddlers or the market, as far as they knew? No, it was because they were so clean and so near the same size and shape.

Does it pay to deliver nothing but clean, fresh eggs, eggs that are all about the same size and shape? Try it and you will find that it pays big returns.

I am making 150 chickens keep healthy in a chicken coop 8 feet wide by 30 feet long and also making the pullets lay their 75 per cent every day and that at an altitude of 8,000 feet, where we have some real weather. JACK DOUGLAS. Utah.

Miller's Ideal Mammoth Incubators

The Most Efficient Hatching Equipment On the Market — By J. W. Miller

That is what experienced poultrymen all over the country say about Miller Ideal Mammoth Incubators. Their verdict means more to you than any statement I could make for they are keen judges of incubator values.

No other incubator offers so much in correctness of design, in workmanship and in efficiency of operation. In it is the accumulated experience of 34 years—the practical application of a lifetime devoted to studying the requirements of the modern poultryman. And now, with the Ideal Mammoth a tried and tested success in the hands of many of the most prominent poultrymen in the country, I can truthfully call it my greatest achievement.

Mammoth Triple Deck Incubators

The Ideal Mammoth Triple Deck Incubator is supreme in the field. It is the only three-deck machine that maintains a uniform temperature in all three decks—accomplished by a specially designed heating system. The compactness of the Triple Deck Mammoth reduces operating costs to a minimum. It allows the installation of greater egg capacity with a minimum amount of floor space required.

Remember that the unit form of construction in Ideal Mammoth Incubators allows you to start hatches on any scale desired and add more units as your business grows.

Write today for my new catalog. It tells the whole story and shows you the way to increased profits on every hatch. Special offer to those who order early.

J. W. Miller Co.,
Rockford, Illinois.

Gentlemen:

Owing to the fine results we have had with our Ideal Mammoth Triple Deck machine purchased from you last season, we feel that we would be doing you an injustice if we did not tell you of the splendid hatches we have had.

I have operated a good many different makes of incubators, and your Ideal Mammoth has one of the finest heating systems I have ever seen. The Ideal Triple Deck is a wonderful space saver, and we find the top deck hatches equally as well as the lower and middle deck.

Recently we pulled off a wonderful hatch, running 83% of all eggs set, and our help told me they took as high as 159 good, strong chicks off of the trays that had only 168 eggs to start with.

Thanking you for your fine treatment.

Yours very truly,

PIERCE SUPERIOR CHICK HATCHERY

E. M. Pierce, Manager.

"SUCCESSFUL" Sectional Steel Grain Sprouter

A Little Heat — 15 Minutes Daily
Attention — A Weeks Time And
Your Hens Are Provided With
Best Egg Making Feed.

Lower Your Feed Bill

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1923 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" GRAIN SPROUTER

Practically All Steel—Made in Sections
With New Safety Lamp—Safe in Any Part of House or Barn

Double steel walls—metal trays. Cannot be compared to wooden sprouters. Warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold. Glass doors. Each section a separate compartment. Start with enough sections for your needs and add more as you need them. Here is a money maker. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day increases the egg yield, cuts feed cost one-third. Write for full details. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cts. Write today.

Butter, Eggs and Milk

There was a time when you had a porch with a honeysuckle on it with lilacs at the gate. You took them for granted, you saw no special beauty in them—everybody had them. Then came a day when you found yourself in a two by four apartment and the lilac and honeysuckle gone forever.

There were many things you took for granted in those lilac and honeysuckle days. Butter, eggs and milk were three of them. Everybody had butter, of course. You always buttered two biscuits while they were hot, you put in a big hunk when you broke open a mealy potato, and for snack spread it thick with brown sugar on a slice of bread. Soups were made tasty with butter; pie crust was rolled with it, and One-Two-Three-Four Cake started with it. Butter, why, of course, how could you cook without butter?

Then with the apartment came boarding-house days and cafeterias. You soon realized that nothing tasted the same; the food was flat; it lacked vim. The butter had a curious luster like ten-cent store pearls. The boarders whispered margarine. You eyed it and greased your bread with just enough of it to make the bread slip down. And so butter, another commonplace like honeysuckle and lilacs, was gone from your life.

Time was when as a youngster you used to drink lots of milk, then somehow you lost the habit as big boys do. "Aw," you would say, "put it in the biscuit and gravy and cake." It went in, too; Mother believed in plenty of milk in cooking and baking, and you got your share of milk. It put quality in food and quality was another one of those things you took for granted until you lost it.

It seemed to go with the coming of oleo; but there was more to the story than just oleo. You wondered. The cream soups, creamed meats and custards all tasted the same and none of them tasted like real food. Then the limit was reached in chocolate custard that seemed to be topped with whipped cream. You knew how the custard would taste, but surely whipped cream—there was a curious flavor. It certainly wasn't cream. You knew cream. Mother always topped jelly with it and chocolate pie and just piled it on strawberry shortcake.

What was the stuff anyhow that whipped like cream and tasted like nothing? Then the secret came out. You picked up a trade recipe book thrown in at the door and recognized the name on the cover as that on a case of canned milk delivered to your landlady. The little book was interesting reading. The thing that whipped was not milk, but a compound of skimmed milk and coconut oil. The product was highly recommended for creamed soups, creamed vegetables, creamed meats, biscuit, gravy, cakes, even chocolate and coffee. And you knew that you had been eating things made with this oil compound instead of natural creamy milk.

And so milk passed from your life along with butter, and the only question that now remains to be settled is how long the mortal frame can stand being robbed of all the foods that have made it what it is.

Then there is "filled milk." The product is new. "Filled milk" is a compound of separator skimmed milk and coconut oil. Most of it is manufactured by the same people who put up whole evaporated milk. "Filled milk" is what the manufacturers call a by-product, which means in this particular case that they sell off the butter fat from milk and then evaporate the "Blue John" emulsified with coconut oil and sell it as a compound to be used in cooking and baking instead of whole milk.

What is "filled milk" like? Well, the manufacturers have done a good job. They have been able to manufacture a compound that looks like evaporated milk, smells like it and tastes like it—until it gets stale. It fools the eye, the nose and the tongue, but—and here is the point to bear in mind—the butter fat left in it is the only milk that will do the building and repairing needed there. "Filled milk" cannot be substituted for cow's milk because coconut oil has no growth stimulating qualities, vitamin A is not in it. If this precious vitamin is omitted from foods the human body will certainly tell the tale.

There is just one economical solution of this problem, and it is the old way of your mother and grandmother before you—use real butter, eggs and milk for good cooking and nutritious food. You give your family cream soups and custards for the sake of the milk that is in them; why substitute "filled milk"? If canned milk is more convenient for cooking, use whole evaporated milk, which contains real butter fat and not coconut oil. "Filled milk" is not for any good provider who plans food to build stout bodies.

White Wyandottes

I am a great admirer of the White Wyandotte from the fancy and utility standpoint. They are growing very rapidly and are nearly always the largest class exhibited at the leading poultry shows.

If bred right and properly taken care of, what more beautiful fowl exists than the White Wyandotte? It is a bird of graceful curves and anybody who has seen a flock of well-bred White Wyandottes in the show-room or on free range knows how strictly fancy they are.

They excel as all-year layers because with proper handling they will lay about as many eggs during the Winter months as during Summer ones, making the total value of their eggs for the year very high. It has been proved in many egg-laying contests that the White Wyandotte lays more eggs than the White Leghorn and many other breeds of poultry. They are well built for egg production, having width, height and a moderate length. These points taken together mean capacity.

The White Wyandotte lays a large, well shaped, brown egg which brings a higher price in Saratoga Springs, my locality, in New York and in Boston than the small, white egg of the White Leghorn.

They have the correct size and compact build for an ideal market fowl. Their meat is lighter in color and is very tender and juicy, which brings a much higher price than the skinny, tough meat of the Leghorn. They make splendid broilers. The chicks grow rapidly, stand plenty of forcing and the percentage of mortality being very low. They have a nice yellow skin and leg and no dark pinfeathers to spoil their appearance.

No breed is better suited to a cold climate than the White Wyandotte. They have a rose comb and are so loosely feathered that they can stand a great amount of cold weather.

They are one of the most docile of fowls and stand confinement well, and if given a free range, they make splendid foragers. This advantage makes them very well suited to the man whose space and yard room is limited.

With some breeds a great many chicks die in the shell, being unable to break through the tough membrane beneath the shell. This is not true with White Wyandottes. For a large fowl the eggs hatch very well, large hatchlings usually being the result. The hens make excellent mothers, being not too large and very gentle. A large percentage of the hens never set at all and those that do are easily broken up.

For their size they are small eaters and require very little more feed per bird than the White Leghorn.

The White Wyandotte, if properly cared for and housed, are seldom sick. They are a healthy bird if kept properly.

I have tried to describe the White Wyandotte as they really are. I may be enthusiastic, but as a profitable and fancy breed the White Wyandotte undoubtedly leads on account of its splendid laying qualities and on account of its beauty.

N. Y. ALTON C. CHAMBERLIN.

Starting a Poultry Farm

I have noticed a few articles in the American Poultry Journal referring to the cost of starting a poultry farm. All of these articles are very interesting and valuable. Of course, we do not all have the same view of starting into poultry raising. Some prefer to start slow, and gradually work their way through. Others see the need of big capital in order to start successfully.

There is nothing wrong in either of these methods, providing the person himself or herself is qualified for the job, and loves the work. Some time ago Mr. Forster wrote an article on this subject. This article was criticized as to its merit. I do not think it is proper to pass remarks in regard to Mr. Forster's personal view of starting an up-to-date and modern poultry plant, and I do not think his figures were so extremely high.

He preferred to be on the safe side and have sufficient capital on hand to meet all expenses in rearing a large flock to maturity. He preferred to do the business in a modern and business-like way from the start. I have been told and I know personally that there are many interested poultrymen that have failed because of a lack of sufficient capital to start with. There might be other causes too, such as lack of knowledge and so on, but we all know that capital is required and absolutely needed.

Personally I am interested in poultry and am preparing to enter into it. My capital is almost nothing, but my will is good, and I

Silver Campines

Green Sheen Strain

I HAVE 400 Campines, 1922 hatch. The oldest pullets are now mature and laying and the cockerels are strong and lusty. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

Statement of the Ownership, Management, Circulation, etc., Required by the Act of Congress of August 24, 1912

OF AMERICAN POULTRY JOURNAL, published monthly at Chicago, Ill., for October, 1922. State of Illinois, County of Cook, ss:

Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the American Poultry Journal, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—James W. Bell & Co., 523 Plymouth Court, Chicago, Ill.
Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Managing Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.
Business Manager—James W. Bell, 523 Plymouth Court, Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)
James W. Bell, 523 Plymouth Court, Chicago, Ill.

H. M. Bell, Congress Park, Ill.
Henry G. Eisert, 523 Plymouth Court, Chicago, Ill.

B. M. Eisert, 5535 Magnolia Ave., Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state).—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and security in a capacity other than that of a bona fide owner, and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown is— (This information is required from daily publications only.)

JAMES W. BELL, Editor.

Sworn to and subscribed before me this thirtieth day of September, 1922.
(SEAL) ALICE A. SHEHAN, Notary Public.

(My commission expires June 20, 1924.)

CHARLES G. PAPE, Box B 74, FORT WAYNE, IND.

believe there is a way for me. My intention is to gradually work into the business.

It appears to me that if the work is managed properly there is profit in poultry. To manage a poultry plant properly combines money considerations. A poultryman to succeed must be on the constant lookout. He must not waste. To fuss around his flock more than needed, takes too much of valuable time, but I do not believe in too extreme saving as that may lead to starvation rations for the flock.

I believe the poultryman should do a good day's work and use common sense in doing so. Do not think you are going to get an easy living by hanging around and depending upon somebody else to do your work.

I can picture out in my mind the humble beginning and hard work some of our noted breeders have gone through. They have succeeded because they love the work, also they did their work with a will and were always ready to please their customers.

I have been told many times that there is no money in poultry. In some instances this is true. There is no money in it for those who are not fit for such an undertaking. If you dislike it you cannot succeed anymore in poultry than in any other line of business.

People in general do not understand the art of raising poultry. They do not understand that raising standard fowls is a profession. They do not understand that our birds today, our standard bred poultry, is a result of science and skill, and that many famous breeders have spent their entire lives to produce the birds that today are a pride to the world.

Michigan.

J. Ferdinand Nelson.

Poultry Educational Work in Oregon

Oregon has made rapid strides recently as a poultry state. Ten years ago eggs were shipped in from Iowa and other Middle West states for local consumption. The past three years the production in Oregon has increased more than 100 per cent and now Oregon eggs are being marketed in New York in successful competition with eggs from the middle western and eastern points. The Pacific Cooperative Poultry Producers' Association alone, last year handled one hundred carloads of eggs on the New York and other eastern markets. This increased production is due to two things: First, development to adequate marketing facilities; second, the increase in production per individual as a result of better breeding and production methods.

Leading the advancement of Oregon as a poultry state has been the poultry department of the Oregon Agricultural College, which has attracted international attention by its development of high producing individuals and also high producing flocks. Fourteen years ago 216 eggs was the best individual record at the college, and the flock records were 85 for Barred Plymouth Rocks and 104 for White Leghorns. Four years ago the average of all of the flocks at the college was 206 eggs, an increase of more than 100 per cent, while the individual high record was 308 eggs. Recently a new high mark of 316 eggs was reached by Barred Rock, Lady Dryden.

One man gives his entire attention to extension work in poultry husbandry, establishing in the state by practical demonstrations proven and progressive methods of poultry management. The work of this specialist, H. E. Cosby, is organized on a unique basis. When he took up the work it was decided that extension work needed to be brought out of the pioneer stage of answering miscellaneous calls and holding miscellaneous meetings, with no well planned follow-up work. Farmers and poultrymen were tired of extension schools, farmers' institutes, and abstract meetings, generally, by reason, it is thought, of the excessive number of such meetings held during the war period. It was evident, according to Mr. Cosby, that what the farmer wanted in an extension way was a community rather than a county unit, a farm rather than a hall, and a concrete rather than an abstract meeting. In outlining the work it developed that by dividing the year into seasonal phases of management, about four divisions of poultry husbandry were segregated. Mr. Cosby then divided the year into four periods of three months each, placing emphasis upon a certain phase of poultry management in each period. It was decided to locate the demonstration work definitely on as many farms in the different counties as could be conveniently handled by the specialist, and hold on these farms four seasonal meetings. The farmers agreed to keep satisfactory records and

Among the Fowls in Winter

This is the time of profitable money, during these months November, December, January and February, because eggs will sell at least 5 cents each at this season. Every fowl that has been laying at full swing in the summer days may fall down in these cold months unless the keeper has his fowls in good vigorous health and good flesh.

To promote good physical conditions he must feed according to his breed or he may not accomplish results. The smaller breeds will not put on flesh as rapidly as those of the general purpose type. A little more feeding of grain than usual in the late fall will put Leghorn pullets in condition. The poultry must be warm, but not allowed to be indolent. There must be a deep litter of straw on the floor continually, into which all grain is scattered, compelling the layers to dig and search for every grain consumed. Unless this is done the best birds are apt to eat too rapidly with no exercise. "Workless hens are layless hens."

The busy hens that are always on the move, singing, scratching and laying, are the profitable hens.

Give the fowls during the winter months a supply of succulent green feed. By succulent we mean any green vegetation that is leafy, tender and juicy. Anything tough or dried is less digestible and may as well not be fed.

Sprouted oats is an excellent egg maker and well relished by the fowls. Sprouted oats is a cheap feed and almost anybody who can hit the nail on the head can build a sprouter. Make it about 3½ or 4 inches high. You can make it to accommodate 3, 4 or 6 trays, according to the number of hens you keep. The trays can be galvanized iron pans or anything with perforated bottoms to prevent mold. When the sprouts are about 2 inches high, feed a little at noon. Scatter it on the litter.

In winter the fowls will have no water to drink if the founts freeze. This should be avoided. Two-thirds of the egg is water, and unless the hen has water continually to drink she may not consume either enough water or dry mash.

It is true that a hen cannot lay half an egg. If you are feeding a ration that produces enough to make the egg substance and just half enough carbonate of lime for the egg shell, you cannot expect a finished article; but if you are feeding a balanced ration you will obtain the complete production that you want.

Oyster shells, grit and charcoal should always be within reach of the fowls. Oyster shell supplies the lime for the egg shell. Often hens unsupplied with shell will eat eggs or will get fat and not lay.

The best thing to do when a hen starts the habit of egg eating is to remove her from the rest. You may have to fry her. Her presence in the flock will set a bad example which will become contagious, and sooner or later the whole flock will learn the habit.

Some poultry men raise poultry without using charcoal. It is not a feed, but a purifier for the digestive system. Young chicks should have it to prevent white diarrhea.

Grit is an essential in the hen's diet. Some poultry keepers never supply any grit. This is a great mistake. Maybe they do not know that grit not only helps to grind the feed for the hen, but it contains some mineral food. Limestone grits are poor grits because they are too soft for the purpose and are used up much quicker than harder grits, but limestone has the advantage of serving the double purpose of grit and oyster shell.

Iowa. Donald Peterson.

5 Gallon Capacity. Price \$6.00 f. o. b. New London, Conn.; St. Louis, or Wichita, Kans.

Winter Egg Production Depends Upon Water

November is the month of highest prices in the egg market because fresh laid eggs are scarce. It is also the month of cold nights and mornings, and 74% of the reason for the scarcity of fresh eggs is lack of drinkable water in the poultry house, for it is an established fact that water is three times as important as feed in egg production.

You simply cannot make a bird drink ice water in sufficient quantities to produce eggs. Nature compels her to drink some for blood and food assimilation, but that small quantity is not enough to put 74% in the egg.

The Norwich Automatic Air-Lock Fountain supplies water with the chill removed regardless of weather, and the birds drink just as freely as in summer, with the result that they consume the necessary 74% water and produce eggs.

We are so sure of this that if it is your custom to water your birds but once a day during the winter, we will guarantee to double your egg production by equipping your pens with Norwich Automatic Air-Lock Fountains.

Send for booklet. Yours for the asking.

Guineas

As many persons do not seem to have any great amount of success raising that very profitable fowl, the guinea, I will recall a few of my experiences along this line.

Some years ago a friend of mine gave me a setting of eggs and all of them hatched, but, unfortunately, only four of them grew up, and with these I got a start, and profit as well as pleasure has been the result.

I long ago found out that the bird was well worth raising, and that a good flock, with the right kind of care, could add an addition of the "long green" to the annual income.

My experience has been varied. I have had some success with the guinea fowl, and for the sake of those who may be interested in this unique bird, I will give a few points on the necessary care of the fowl.

Guineas have a fondness to hide their nest far from the house, and it is no easy task to find same.

This peculiar trait should be overcome. You may first try by coaxing the hens to build their nest near the house, where you can look after the eggs; but if this fails you should fasten up the birds in a house fitted out with plenty of inviting nests, and do not let them out until they have started to lay in those nests.

It is best to set the eggs under chicken hens, yet good broods have been raised by guinea hens.

I nearly always place the brood coops under a shed and keep the mother hen confined for a day or so in order to give the young a chance to strengthen. This I also do on rainy days. The young are very tender and much exposure to weather will result in the loss of the little guineas.

As to feeding, I prefer crumbly corn meal dough in preference to anything I have found. Hard bread soaked in sweet milk is excellent. Fresh, clean drinking water should be provided and the young fed at least five times a day until they are a month old. After that plenty of free range and they will need very little feed, but should be fed some small grain twice a day.

When they are ready for market you handle them just as you would chickens; and you will find the market good. If you raise for your own use you could find no better meat anywhere.

Once started to laying, they will lay more eggs in a month than the best chickens I know of. But in the course of a year their egg production would be less.

Virginia.

C. G. Gates.

Utility Type

As a subscriber and breeder of Leghorns, I wish to commend your stand for a chicken "under the feathers," for that is all we utility breeders can ask for. I try to breed as near to standard as possible and wish to say in this connection that hens of standard type are as good layers as the high tailed, unsightly kind, but many strains of exhibition Leghorns are poor layers, as they have been bred solely for beauty, with no attention paid to laying ability. Would also like to see you come out squarely for the abolition of the utility classes at A. P. A. shows, as there is too much faking, etc., in these exhibits, and the so-called "experts" who do the judging give a regular poultry grower severe pains in the neck. As you know there is no egg type in Leghorns, so how can you judge them? Anybody can pick out the fowls that have been heavy producers, but who can forecast them? For an example, last year I had a long legged, crow headed pullet weighing five pounds and standing as high as a cockerel. As a horrible example, I placed her in a pen which I was trapedsted and to my surprise she was second in the pen, running well over 200 eggs. And the utility classes of Rocks, etc., at the shows are a standing joke. Who wants Rocks and Reds no larger than Leghorns?

In regard to the Black Giants, think it would be a good plan for you to caution your readers not to expect too much from this breed. I have a pen of about 50 and find that they make fine large capons and

roasters. As layers they are not as good as Rocks, Reds or Wyandottes. As broilers they are unsatisfactory account of black feathers. Do not think they are being used for capons as much in this section as they were formerly. One farmer who rears from 500 to 1000 capons told me a year ago that he had discarded the Black Giants because of so many of them having a white skin, and had gone back to Barred Rocks.

Do not think that I am knocking this breed, as I am raising them myself and like them, but there is no use claiming that they have all other breeds outclassed. As table fowls they are about the same as Orpingtons or very heavy Rocks. But one point which Black Giant breeders can boast of is their hardness; also their quality of ranging like Leghorns for forage. Think they will ultimately find their right place as the ideal fowl for large farms, where a fair amount of eggs and a large amount of meat is wanted. Black Giants also, at present, throw a considerable percentage of off-colored chicks, some with a few red feathers, others barred, some feathered on shanks, and I had one this year come snow white.

New Jersey.

D. H. Sturtevant.

Helpful Devices

They say "necessity is the mother of invention." This certainly applies to the poultry yard. The average small poultryman has limited capital, and therefore cannot afford much expenditure of money. Consequently he must resort to home-made devices which while they are crude, often serve the purpose.

Probably a pulley is needed to carry a rope to a window or to the exit door used by the fowls, so that by pulling on the cord they may be made to open and shut as required. There not being a regular pulley at hand, a spool is called into service—just an ordinary sewing thread spool—and this is fastened to a beam rafter or some other object by using a wire nail. The nail is run through the opening of the spool and driven into the solid object as stated. When the cord is drawn over the spool the latter revolves and does the work of an iron pulley.

When putting up wire-netting fencing it is not uncommon to find the wire staples have been mislaid or all used up. As a substitute small lath nails driven in the posts and then bent upwards serve the purpose of the staples, and some people prefer them to the real article. Probably there is a long stretch of wire netting to put up and there is a scarcity of posts. This can be overcome by running a heavy wire through the top of the wire fence and tacking it on the tops of the posts. This will hold the wire firm. The posts thus may be placed from 16 to 32 feet apart with good effect.

Strong winds frequently lay havoc with gates open and bending the hinges when the buttons through continual shaking loosen up. This may be prevented by using wire instead of buttons. The wire should be run through the frame of the gate by means of a small gimlet hole through which the wire is drawn, then bent over on each side of the gate to form the letter "U." The bottom of the letter "U" represents the part that goes through the frame of the gate and the sides of the letter are the parts that come down on each side of the post. This holds the gate firm.

A cock bird on each side of the fence is sure to cause a fight, striking the fence with such force as to cut their combs and sometimes injuring themselves so that their day of usefulness is ended. Have a double fence; that is, on one side of the regular fence erect a three-foot high fence and have it standing out about six inches from the main one. After several unsuccessful attempts to reach each other the fight is generally called off. It is worth more than the cost of the netting and labor to do this.

A handy device for chopping and mixing food for poultry can be made from material found on many farms or a blacksmith will make one at little expense. For the cutting blades use two pieces of steel a little heavier than old barrel hoops each about 1 1/2 inches wide and 8 inches long. Procure a 1/2-inch

iron rod about 3 feet long, bend one end in the shape of a spade handle and split the other end for a distance of about 2½ inches. Sharpen one edge of each blade and curve the metal slightly. Lay the two blades together with the convex sides touching in the center and insert them in the slit in the handle end. They are riveted or welded in place. Heat and bend the blades at right angles. The food may be chopped in an ordinary pail having a strong bottom, but it is best to make a box about 1½ feet square and with a plank bottom for use with the chopper.

In sprouting oats to feed it is a good plan to make a cheap chest of drawers, each drawer consisting of a shallow frame with a bottom of burlap stretched tight. There should be seven drawers in all, one being labeled for each day in the week. The way to make use of such a device is as follows: On Monday a small quantity of dry oats should be put in the drawer bearing the Monday label, and sprinkled with tepid water. On Tuesday the same procedure should be followed with the second drawer and so on through the week. Seven days from the first Monday the first drawer will contain in bulk about five times the original contents, consisting now of fine tender shoots and rootlets which fowls prefer in winter to almost any other known feed. This mass should be removed and the drawer refilled with oats and be sprinkled as before. By following this same practice the right quantity of an ideal winter feed is had each day, cheap as to cost and very efficient.

It is often necessary to move a number of fowls from one place to another. For this purpose we use a poultry carrier which is a frame covered with heavy wire netting and fitted with a door and handles. It can be carried by two persons or wheeled on a wheelbarrow. It is a great convenience, as it makes possible the shifting of a number of hens at one time.

We use a short handled hoe for cleaning off the roosts in the poultry house. Any old hoe can be cut down so that you have a handle about 3 feet long. If your roosts are narrow or with but one perch, make the handle shorter. You will find that this works to perfection in cleaning the roosts. We use a splint basket for holding the droppings as the roosts are being cleaned. The handle of the basket is removed and one side held close to the edge of the dropping board and the manure scraped into it. The droppings are carefully preserved in barrels and used in the garden, as they are one of the most valuable of fertilizing materials.

Keep a small stock of colored spiral leg bands on hand. These are handy for the farm flock where no tramping is done. They can be purchased in several colors, one color for year-old hens and another for two-year-olds. The pullets need not be banded, as the lack of band will then mark the bird as a pullet. It pays to band all birds sold for breeding stock. The buyers often lack bands and they appreciate having the stock banded so that it can be distinguished from the birds in the home flock.

Quarter-inch mesh wire on the poultry house windows will keep out sparrows. These pests carry tuberculosis and other poultry diseases from infected to clean flocks. They should be trapped and prevented from roosting in the poultry houses. In the winter they can be poisoned on the range without the danger of killing poultry or song birds.

During the winter it pays to order spring poultry equipment. When the eggs are ready to set it is too late to order an incubator. When the chicks are peeping the brooder must be ready for use and not resting in a freight car a hundred miles away. With the equipment on hand the worries of the poultry business are greatly reduced and late spring orders are often unexpectedly delayed, causing financial loss and discouragement.

The September 15th issue of the South West Poultry Breeder, Texas, contains as its leading article, signed by its editor, E. B. Miller, and Judge E. C. Branch, a pillaged, plagiarized reprint of our report of the Knoxville A. P. A. convention. On top of this, three editorial notes are reprinted without credit.

Here's The Grain Sprouter You Want

30 Day's Trial—Money Back if Not Satisfied

Here's the grain sprouter that exactly meets the requirements of every poultryman. Whether you have a flock of 50 chickens or several thousand there's a style and size of

WISCONSIN SECTIONAL GRAIN SPROUTER

to meet your needs—you add extra sections as you need them. Wisconsin Grain Sprouters, like the famous Wisconsin Incubators are built right. Strong wooden frame—heavy galvanized sides lined with thick sheets of Nuroid to retain heat. Wisconsin's are not affected by moisture—they can't warp, shrink or swell. Converts one bushel of grain into 3 bushels of tender sprouts.

Sold on 30 day's trial. Write for free catalog—learn how much better Wisconsin's are constructed, and how much lower our prices are than others. We pay freight—don't buy until you get our catalog. We can save you money.

Mayslake Buff Orpingtons

An Unparalleled Record

Following up their great VICTORY at NEW YORK STATE FAIR, September, 1922, where they won CHAMPIONSHIP BEST DISPLAY (2nd consecutive year), 3 Firsts, 2 Seconds, 1 Third, 2 Fourths, and all Specials offered but one,

MAKE ANOTHER STUPENDOUS WIN at TRI-STATE FAIR, MEMPHIS, September, 1922—1-2-3 Cocks; 1-2-3-4 Cockerels; 1-2-3 Hens; 1-2-3-4 Pullets; 1-2 Pens (young); 1-2 Pens (old); GRAND CHAMPIONSHIP BEST COCK in show; GRAND CHAMPIONSHIP BEST PULLET in show; CHAMPIONSHIP BEST DISPLAY; 275 Orpingtons competing.

Points of Superiority of Mayslake Buff Orpingtons

1. They are line-bred and one of the oldest and leading strains in America.
2. They have won for us in strongest competition at America's leading shows past two years—At Chicago, Coliseum; New York State Fair; Ohio State Fair; Tri-State Fair, Memphis, Tenn., they recorded 27 Firsts, 17 Seconds, 17 times First and Second in same class, 5 times Championship Best Display, twice Best Cock in show, once Best Cockerel, and once Best Pullet in show, 3 times Best Bird in entire show in 32 classes competed in.
3. They have won for our customers Championships, blue ribbons and other leading awards at Canadian and America's best shows—Chicago-National, Greater Milwaukee, Illinois State Show, Missouri State Show, St. Louis, Kansas City, San Antonio, So. Western Exposition, Texas, and Canadian National Exposition.
4. They stand pre-eminent for color at the desired exhibition shade of buff, combined with great size, and true Orpington type, and are the greatest layers and table fowl—a combination that make them doubly profitable.
5. They bring repeated success and give entire satisfaction as breeders for exhibition and for laying. Hundreds of birds of the same breeding as our winners and layers at prices within reach of all.

SPECIAL this month only—25 Farm range large breeding Cockerels at \$5 each.

Farm Buff Orpingtons,

EGGS 90 CENTS A DOZEN WHOLESALE

U. L. Meloney, President of J. W. Meloney & Co., commission merchants, New York City, writes under date of Oct. 18, 1922:

"Did not think it possible for market to reach such prices on eggs, but you will note in today's Price-Current that here we are again close to a dollar a dozen wholesale on the best."

The Producers Price Current for Oct. 18th, quoted New Jersey, hennery whites, uncandled extras, at 81 cents. The same grade candled locally by receivers at 86 cents. There was no price quotation on the top grade, composed of New Jersey, hennery white, extra fancy candled selections, and these commanded about 90 cents wholesale.

Receipts are running below last year. Fancy nearby whites are very firm and average higher under a scarcity.

The average and under grades of whites moved more slowly and trade in cold-storage whites was quiet.

There is considerable pressure to sell refrigerator stocks by some holders, the poorer grades selling very slowly. The proportion of fancy grades is too short, forcing prices high. The result is a very wide range of prices necessary to cover the market.

The market, Oct. 18th, quoted:

Refrigerator extra firsts, charges paid to expiring date.....	29@32
Refrigerator, whites, nearby.....	32@41
Refrigerator, whites, Pacific Coast	32@42
Fresh gathered, extras.....	53@56
Fresh gathered, lower grades.....	20@27
Nearby white, pullets.....	42@65
Nearby hennery, white.....	84@86
New Jersey, hennery white, extra fancy, candled selections.....	@
Pacific Coast, whites, extras.....	78@80
Pacific Coast, mediums.....	52@63
Other western and southern gathered whites	44@62
Nearby and nearby western, hennery browns, fancy to extra fancy	56@64

Different Kinds of White Plumage.

Respecting white fowls. There are at least four different variations of white plumage, each with its own special properties: (1) dominant white of the White Leghorn; (2) recessive white of Rose Comb Bantams; (3) recessive white of Silky fowls; (4) white (splashed) of Andalusians and Blue Langshans.

Crossed with Brown Leghorn: (1) produces all white progeny, with a few colored feathers; (2) and (3) give all wholly colored birds, with the pigmentation of the plumage as fully developed as the pure Brown Leghorn; whilst (4) so-called sports) if mated with black fowls will give blue progeny.—Poultry, Australia.

Each year more farmers are providing a good poultry house and keeping pullets housed during the winter months. Pullets will mature more rapidly when housed than when on range. Housed pullets are kept near the feed and will consume more grain and mash. After pullets are once housed they should be confined until settled weather comes in the spring, as alternate turning out and cooping up makes them discontented.

One foot of mash hopper feeding space should be provided for each twelve to fifteen hens.

A Mammoth Incubator

Out of Southern California, where all things are "the largest on earth," comes another big thing. It is the 3,000,000 egg capacity incubator built by C. G. Sparks and A. O. Melcher, Southern California, a three-story, hollow tile, insulated building as an aid to the walnut growing industry of the Anaheim section. The incubator was built by walnut growers who felt that the fertilizer problem could be solved by raising poultry as a side-line, and the huge incubator was designed to put a large number of walnut growers in the poultry business this winter.

The incubator building has been completed, it is already hatching eggs on the custom basis, and the builders who invested \$17,000

Mammoth 3,000,000 egg incubator.

in it feel that their outlay of money was justified. Of course the capacity of the building may not be reached for years, or at all, but Messrs. Sparks and Melcher are in a position to take all the business their fellow walnut growers throw them. The price for hatching eggs has been set at three cents per chick, the eggs to be furnished by the growers. In incubating the production of their own flock, they have gotten a 94 per cent hatch.

The Sparks-Melcher incubator is 65 feet in diameter, and 36 feet from the cellar to the roof. It is the first of its type attempted in California at least. Its builders spent two years in preliminary study and planning before they commenced building it.

A heating system is installed in the basement, and pipes radiate sufficient heat in each of the 12 incubation chambers, each one of which has a capacity of 250,000 chicks. In each chamber are 17 rows of egg trays, stacked

Floor plan of incubator. There are six incubator rooms on each of the two upper floors. "V," ventilating shafts.

one above the other. There is a space of one foot between the ceiling and the top of each wall, or partition between the rooms, to provide for an even temperature. There is a ventilation shaft in the center of each room on the two upper floors.

At first the attendants were troubled with the heat in the chambers. But the owners secured workers from the Imperial Valley, where the daily temperature averages well above 100 degrees for the most of the summer, and these men do not seem to mind the heat while turning trays.

Calif.

Clyde C. Hurley.

A box, barrel, or better still a galvanized iron ash can should be put in the poultry house in which grain can be stored. This addition to the house will save a great amount of labor as grain and mash can be taken to the house once a month, and will always be handy for feeding.

Angell Says

Albert Angell Jr.

THE success of the Vitality Line of Poultry Feeds has not been equaled by any other line of commercial feeds in so short a time in the history of the poultry industry.

The reason for the phenomenal growth of Vitality may be attributed largely to the fact that the poultry keepers have confidence in the manufacturers of this feed, knowing that quality is the watch word in the selection of every ingredient that goes into each formula.

The latest nationally known and famous poultry farms to adopt Vitality Feeds and the method of feeding them are Oak Dale Farms, Harry Lamon, Manager, Le Roy, Minn., and H. Cecil Sheppard, The Ancona King, Berea, Ohio.

When men of calibre and reputation as Messrs. Sheppard and Lamon are willing to feed Vitality to their thousands of valuable birds, all other poultry raisers need fear of making no mistake by following in the steps of these two famous poultrymen.

ROSENBAUM BROTHERS,

Albert Angell Jr.

Manager Poultry Feed Department.

Illinois National Egg Laying Contests Adopt Vitality Feeds and Method of Feeding

The Department of Agriculture, Division of Poultry Husbandry, State of Illinois, has awarded the contract for feeding the Illinois National Egg Laying Contests for 1923, at Quincy and Murphysboro, Ill., to Vitality feeds. To the best of our knowledge this is the first time in the history of commercial poultry feeds that the National Egg Laying Contest has placed sufficient confidence in a commercial feed to use it exclusively and seldom, if ever, has a manufacturer been willing to make a public demonstration of the feeding value of their products.

Some of the reasons why Vitality Feeds were selected by the Illinois National Egg Laying Contest are:

First—The feeds are made under the personal supervision of Albert Angell, Jr.

Second—Every bag of feed is guaranteed by Rosenbaum Brothers to give "Absolute Satisfaction when fed according to directions."

Third—The signature of Albert Angell, Jr., on every sack is a guarantee against the use of low grade ingredients, change in formulae, etc.

Fourth—When America's foremost poultry experts such as Harry Lamon and H. Cecil Sheppard indorse and feed Vitality exclusively to their thousands of valuable birds, there is no doubt as to the true feeding value of the Vitality Line.

Fifth—The Illinois National Egg Laying Contests, therefore, in considering what feeds and method of feeding to adopt for the 1923 contests at Quincy and Murphysboro, took into consideration the reputation of the men behind Vitality Feeds as well as those who are using them throughout the country and in deciding to adopt Vitality were governed by these facts.

The results of these contests will be published in the American Poultry Journal in this four-page colored supplement each month with illustrations of the leading pens and individuals in each breed represented.

What Vitality Feeds are accomplishing for thousands of America's successful poultry raisers they will accomplish for you. Simply get in touch with your dealer, follow out the information as given in Scientific Poultry Feeding and Management and you cannot go astray.

ROSENBAUM BROTHERS
Poultry Feed Department
CHICAGO, U. S. A.

Scientific Poultry Feeding and Management

Why You Should Have It

Scientific Poultry Feeding & Management is a standard monthly guide, one which may be used every day in the year. It is for the small as well as large poultry raisers.

Indorsed by poultry authorities as an easy to understand text on general feeding and management.

Fully describes methods of controlling the hen so that she will lay most of her eggs during the season of highest prices. How to raise the most chicks with large bone and frames weighing a pound and more per month according to breed. How to make a living from poultry. Eggs and Poultry for the Home Table. Things the Beginner Should Know. The value of the Poultry Industry in the United States with latest census. The American Hen of Today. Why Chicks die in the shell. When to feed Scratch Grains. The correct proportions of Mash and Scratch Grains in feeding for greatest possible results in egg production. Various types of poultry houses suitable for all climates. The arrangement of the interior of the laying and breeding pens. The importance of using straw for litter purposes a foot deep on the floor. Brooding. The correct temperature. When to feed the first meal. What to do and what not to do every day thereafter until the chick is matured and ready to lay or to be sent to market. How to tell the laying hen from the drone. Characteristics of Layers and Non-Layers. Questionnaire. What to do when the hens don't lay. What to do when the chicks don't grow. A daily egg record and account sheet. How to produce greatest possible gains on least amount of feed.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I am in receipt of the following interesting letter from C. T. Patterson, formerly in charge of the work at the Missouri Poultry Experiment Station at Mountain Grove, and who has established himself on a fruit and poultry farm in recent years:

My farm is located just outside Springfield, Mo., and on one side has the state highway and on the other side the passenger track of the Frisco railroad. About 500 cars pass each day on the highway and 28 passenger trains on the railway. This location naturally attracts many visitors. One of the questions asked most frequently is: "How can we start a poultry farm? and can we grow fruit and chickens on the same land?"

The two questions can be answered at the same time, and instead of giving a theory on how to do it we show how we are handling the work.

I wish I could walk over my place with you and show how we handle the fruit and chickens together, but since I can't do that I will give a description of our work.

The first of April, 1920, I secured our present location, which was then a tract of smooth land containing nothing but oat stubble. We were handicapped in not having any buildings, trees or water, but were not handicapped by the place having been spoiled by some one else. In planning the place it was our aim to locate the fundamental parts of the place as nearly in a central

position as possible; these are the residence, the water supply, the feed supply and incubator building, so as to arrange each line of work in a cycle at the base of operations.

Each gate and door opens from you and each works with springs, so one does not have to bother with a gate latch or door latch, but just press the door or gate and it closes behind you. The yards are arranged so the chickens are alternated, one pen being empty while the chickens are in the other. The fruit is set in these yards to alternate in the same way. There are apple trees in one set of the yards and the other set is planted to peach trees. This makes it possible to spray the apple trees; then, when the chickens are under the apple trees the peach trees can be sprayed. Then when the fruit ripens the birds can be kept away from the trees which are ripening.

The garden and truck patch is west of the residence and begins next to the residence, with annuals such as lettuce, radishes, onions, peas, beans, potatoes, etc. The truck occupies about one-fourth of the garden; then come the perennials, such as strawberries, raspberries, blackberries, grapes etc.

As to varieties of fruits, we have the earliest strawberries to ripen in the spring, and others which cover all the strawberry seasons. The strawberries last until the raspberries are ripe and the raspberries last until the blackberries are ripe, and the blackberries last until the grapes are ripe, and the grapes last until the early peaches and apples are ripe, and they in turn last until the winter apples are ripe; and the winter apples will last in the basement until the berries

Easier than Whitewash

CARBOLA

The Disinfecting White Paint

It takes less than five minutes to mix the Carbola powder with water and have it ready to use as a white paint and powerful disinfectant. *No waiting or straining; no clogging of sprayer.* Does not spoil. Does not peel or flake. Disinfectant is right in the paint powder—one operation instead of two. Gives better results and costs less. Used for years by leading poultry farms.

Your hardware, paint, seed or drug dealer has Carbola, or can get it. If not, order direct.

The Complete Dormant Spray

Let SCALECIDE be your dormant spray. Then you will know that you have done all that can be done at that particular time by any dormant spray or combination of sprays. Fall spraying with SCALECIDE controls pear psylla and peach leaf curl. Spring application controls aphids, pear thrips, leaf minor, case bearer and leaf roller. Either fall or spring spraying with SCALECIDE controls scale, bud moth, European red mite, fungus or blight cankers from which are spread fire blight, collar rot and root rot. And in addition to controlling these insects and diseases, year after year use of SCALECIDE invigorates the trees.

Write today for copy of our guarantee. Ask for booklet, "Spraying the Home Garden." Address Dept. 21.

are ripe in the spring. That is, I suppose they will last that long, although I have heard it said that apples and appetites do not keep well together. However, on the above theoretical cycle I should have fruit practically the year around.

The chickens furnish fertilizer for the trees and the trees furnish shade for the chickens, thus being a benefit to each, which reflects to the profit of the owner.

As the production of chickens and eggs is the main source of income on my farm, a large number of varieties of all kinds of fruits have been planted, which is not a good plan for a commercial orchard, but it will assure more of a continuous supply of fruit, as I figure that some varieties will bear when others do not.

I have had the practical experience of developing four poultry farms, two of which were new places, while the other two were already built. After that experience I am frank to say that we prefer to build a new place.

Some think it takes too long to grow trees, but by referring to the bottom photo in the group I am sending you, you will note the luxuriant growth of peach trees in 2½ years. The peach trees were loaded with peaches this year.

Can grapes be planted in the fall? If so, what is the best time?

Is it advisable to plant cherries and peaches in the fall?

Do you think the Anconas as good layers as the Leghorns?

Kentucky. Minnie Brown.

Except in the extreme northern section of the country hardy grapes can be planted in the fall. October in most sections is the best month in which to make fall plantings.

In the greater part of the country it is best to plant cherry and peach trees in the spring. There are many sections where the winters are mild in which fall planting of these fruits is advisable.

Anconas are as good layers as the Leghorns.

In what part of North Carolina would you advise me to locate and set out an apple orchard?

Are there good hard roads throughout that section of the state?

For what can good orchard land be bought?

How about transportation facilities?

Illinois. C. C. Burton.

The largest and most profitable apple orchards in North Carolina are found in the vicinity of Asheville and Waynesville. That section produces the best Winesap and Stayman apples. There are good hard roads throughout the entire section of western North Carolina.

Good orchard land can be purchased for \$25.00 to \$100.00 per acre.

Transportation facilities are good. The markets of the East are not far away, while the Southern market is right at hand.

I have just returned from a month's stay in that section of the country. I have always thought it the most beautiful and healthful section of all the United States and I am firmer in my belief than ever before.

In reply to H. W. Adams, Wisconsin. Hardwood ashes are very beneficial to fruit trees, berry bushes and shrubbery. They contain potash and other necessary elements of plant food. The ashes should be well scattered and thoroughly incorporated with the soil.

I have just returned from an inspection of the apple orchards in the vicinity of Asheville. Mr. C., Western North Carolina, will this year produce

a very large apple crop. Wherever I went I found the orchards laden with fruit. In that section orchardists give their trees very careful attention, thoroughly spraying, cultivating and pruning the same. The crop of Winesap and Stayman apples is exceedingly large. These orchards are located at an elevation of 2,600 feet, on the average. Beyond all question of doubt the best and most beautiful Winesap and Stayman are produced in this section. These orchards are very profitable and it is seldom that one can be purchased.

What is the best fall apple for me to plant in this section?

Is the Delicious sufficiently hardy to be planted commercially in the central part of this state?

Minnesota. C. H. Hanson.

The Wealthy apple is the best fall apple in existence in the orchards of Minnesota and today is found growing in all sections of the United States. The tree is extremely hardy; the fruit, large, handsome and of good quality. It brings the highest price on the market of all fall apples.

The Delicious is sufficiently hardy for commercial planting in that section. In fact, there are many bearing orchards of this apple in your state. You will make no mistake in planting these two varieties.

I have purchased 20 acres of Miami, Florida, and will plant an orange and grape fruit ranch. I am informed that the Temple orange is the most profitable variety to plant. Can you tell me if this is true?

New Hampshire. D. C. Watson.

The Temple orange was originated near Miami a few years ago. It is only during the past few years that trees of this variety for planting could be secured. This orange is of superior quality and appearance and the tree is hardy and vigorous. You will of course plant in the orange grove one or two other varieties that polonization may be perfect.

Last spring I set out an apple orchard of 12 acres, planting two-year old trees. When is the best time to apply nitrate of soda to these trees to induce rapid growth?

Rhode Island. L. P. Watson.

The best time to apply the Nitrate of Soda to young apple trees will be next spring, just as the trees are bursting into bud. The soda should be scattered very evenly over the surface and the ground thoroughly harrowed thereafter. Do not apply Nitrate of Soda or any other stimulant to the young trees after July 1st. If you do, you will induce late growth which will be too tender to withstand the winter temperature and the trees will be injured.

I have an orchard of rather sloping ground near Lexington, Va. What is the best cover crop I can use in this orchard? It will be necessary for me to get the orchard into sod within the year or two, as the trees will then be in full bearing. I have been informed that bearing apple trees should be cultivated thoroughly each year. The ground is rather too sloping to do this, as it washes badly by excessive rainfall.

Virginia. Harold Finley.

The best cover crop for your section would be rye and oats. A very large majority of the commercial orchardists are agreed that better results are obtained by cultivating apple orchards thoroughly until about the first or

The Egg is $\frac{3}{4}$ Water

Heavy Drinkers are Heavy Layers

Each hen must drink one-fourth pint water every day to produce high priced winter eggs. *Water must be warm.*

Hen's temperature is 110 degrees F. Don't let your hens drink ice cold water a single day this winter, for it will chill to the bone and may stop egg production a whole month.

Why permit unnecessary loss when the

EUREKA Sanitary FOUNTAIN

KEEPS WATER WARM 24 HOURS

No lamp, no fire, no danger. No upkeep. No trouble. *Only up-to-date Sanitary Fountain.* Drinking cup does not project beyond outer can. No possible chance to catch litter or filth. No contamination to cause disease. *Water always warm, clean and pure.*

Made of heavy galvanized iron. Built like fireless cooker. Works like thermos bottle. Simply fill every evening with hot water—that's all. Hens will have plenty of pure, clean, warm water early in the morning just when they want it and need it most.

Water is a natural tonic just as important as feed. Get full value from high priced feeds. Increase egg production and profits by keeping warm water before your hens all the time.

The heavy drinkers are heavy layers. 100 layers will drink 12 to 15 quarts of water a day. Just think of it! The egg is three-fourths water! Every hen you have must drink one-fourth pint water every day or she cannot produce. Only warm water can be consumed in this quantity, in cold weather. *The water must be as nearly*

clean, pure and fresh at all times as the water you drink yourself. This cannot be done with open containers. The *Eureka Sanitary Fountain* is not a luxury. It is a necessity—a year round fountain. It keeps warm water warm 'n winter and cold water cool in summer.

Winter Eggs Bring Big Profits—Get ready now to make these profits. Eggs are now rapidly going up in price. Winter eggs are more than double the summer price. If you get three-fourths as many eggs in winter as you do in early summer you can make four times as much money, for the profit will be infinitely greater. Anyone can make a hen lay in springtime. Only proper care will make them lay when eggs are high.

Money Back Trial Offer

You can't afford to be without the "Eureka." It pays for itself in 30 days. Last years. Thousands of satisfied users. Order today for you take no risk—no chance whatever. If you are not absolutely satisfied that it's the best fountain you ever saw or used, or if you are not entirely satisfied in every way, you get your money back. *Order direct from this ad today. Don't put it off. It means greater profit to you, more eggs than ever before, a healthy, happy, money-making flock. Order at once—NOW!*

Note These Pre-War Prices

DISEASES OF POULTRY

By D. E. SALMON, D. V. M.

Every poultryman needs this book. It contains 250 pages, treating in a most thorough manner on every disease fowls are subject to. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. The cure of all diseases is plainly and thoroughly given, and this book shows you the entire anatomy of your birds, in 72 illustrations, so that you may prevent sickness as well as effect a cure. Price, \$1.00 postpaid.

AMERICAN POULTRY JOURNAL,
523 Plymouth Ct., Chicago, Ill.

middle of July, and then seeding the ground to a cover crop, the cover crop to be plowed under each spring. There are, however, many profitable orchards which are in sod. You will obtain good results by seeding down the orchard to Blue grass or clover, cutting the same each year and placing the crop around the trees. It is when the grass is cut and removed from the field that apple trees do not flourish in sod. I think it the proper thing for you to do to seed down your rather sloping ground to Blue grass and treat it as above mentioned.

* * *

I am considering setting grapes on a knoll containing six or seven acres, none of which is very steep and yet all will drain well, none flat, and is higher than surrounding ground. Soil is rather thin, light clay ("sugar-tree land"); subsoil a reddish-brown clay of a "pebbly" or granular nature. This patch is now growing weeds. I consider planting about 1500 grapevines of the following varieties: Concord, 500; Delicious, 100; Catawba, 50; Niagara, 100; Worden, 200; Eclipse, 100; Delaware 50; Diamond, 100; Moore's Early, 100; Agawan, 50; Brighton, 50 (all these from Stark Bros.), and Juno, 50 (from Rochester Nurseries, Rochester, N. Y. This is a larger list of varieties than is usually put out, so I would like your advice, if any of these varieties have serious faults, or would not be well adapted to this section.

This number of vines would plant about three acres, rows 10 feet apart, vines nine feet apart in the row. Is not this rather close together? for the canes on some varieties will grow 10 feet or more in a single season. Should the ends of canes be pinched back when they begin to interfere with one another? Which is advisable, spring or fall planting, and is there much difference in results? Do rabbits and mice attack fall-set plants as they do young trees? Wouldn't it be advisable to use a subsoil plow when plowing before planting?

Indiana. LeRoy M. Curry.

* * *

You will, in my opinion, make a serious mistake if you plant so many varieties of grapes. Plant two-thirds Concord and one-third Worden. You will then have a good crop of fruit each year—and make money. I hope you will not stick to the list of varieties you submit. Ten by ten feet is about right for grape planting. Do not pinch off ends of canes. Let them grow at will and prune in fall.

Spring planting in your section is safer than fall planting. Fall planting is best where it can be done successfully.

Mice and rabbits sometimes injure grape vines in the winter.

A sub-soil plow is usually needed in land such as you refer to.

You can secure the Royal Purple raspberry plants from any eastern nursery.

* * *

I have been reading your department in the Journal and have noticed that you think around Ashville, N. C., and parts of Virginia, are ideal for climate. As I have been thinking of going to Chattanooga, Tenn., would like to know if I will find the same climate as in Ashville. Also what apple trees would you advise for the section around Chattanooga? Do you know what land is worth there that would be near the city and good for fruit and chickens? Is Chattanooga a good market for such? Is there a building and loan company in Chattanooga?

Illinois

Frank Staubitz

The conditions, climate and otherwise near Chattanooga are not as favorable as the recognized apple section of North Carolina and Virginia. There are some few apple orchards in the vicinity of Chattanooga, in which Stayman and Virginia Beauty are profitable. Orchard land can be bought for \$25 to \$100 an acre. I think a small fruit farm, that combined with poultry, would pay well there. Chattanooga is an excellent market. There is a building association in it, the raising of raspberries, grapes, etc.,

The Breeding of Silver Laced Wyandotte Pullets

By J. M. PHILIPSON, England

What I have to say is intended for the benefit of novices, as many old breeders know how to breed Silver Laced Wyandotte pullets just as well as I do. At our general meeting, held in Stockport, it was moved by an old member that one type of lacing be aimed at, so that every breeder would breed for that type; but I have bred now well over 30 years, and I have always found that judges and breeders differ in their opinions about the type of lacing, so you can take it from me that you need not be afraid who you show under if your pullet or hen has the qualities I will describe.

Let her be good Wyandotte shape, with good size (the bigger the better), a nice broad deep body, and good hackle and legs. See that she is well and evenly laced around every feather, with pure white centers and sound green black lacing. Then, be she heavily or openly laced, with long shaped feather or oval, you have a good one, that if shown nice and fit is going to do some winning. But for myself I prefer rather a long-feather, nice and open, and if well laced, and a sound black, you can't get it too open. These are the pullets that are hardest to breed, and when you get one like this she will win under good judges every time, as there are never many of this sort in a season.

Now I will tell you the way I make my pens to produce these winners. I select a pen of very open-laced hens or pullets. With them I mate a rather heavy-laced cock or cockerel, as sound in lacing and as green in black as possible, bred from a real good, rather heavily-laced hen. From a pen of this mating I have bred many winning pullets. Another very successful pen is rather heavily-laced hens mated with a fine-laced cockerel. These matings generally breed pullets of a nice level medium type of lacing, so attractive in the show pen. If you are mating good exhibition hens or pullets, don't choose a cockerel too open on breast and wing. Be sure that he is bred from a good even clear-laced hen, as all silver-laced have a tendency to breed lighter-laced chickens than themselves; and if you have mated your pens too open, the fault will be pullets of poor black on cushion or not laced round the feather at top of breast.

Many good pullets have a trick of molting very mossy the second season. Don't discard them for this. They will breed just as well as they did the first season, and may molt quite clear the next time. The thing to be most careful about is to select your breeding cockerels from the best laced and clear-laced hens or pullets, as it is from the male side that you get the pure white centers in choosing a cockerel to breed. I like them to have a lot of pullet lacing on saddle or tail coverts, and a dark or ticked back and shoulders, with well-laced, clean-cut wing bars and well-laced wing ends. Such a cockerel can't fail to sire some good show pullets. There are lots of good birds never shown because their owners think they have no chance; but it is surprising how some judges differ in their ideas of a good Silver, and often you don't know what will win until the cards are up.

World's Poultry Congress

The International Association of Poultry Instructors and Investigators has received from the Spanish government a hearty and cordial invitation for holding the Second World's Poultry Congress in Spain during 1924, supported by the municipality of the city of Barcelona and the committee of the Universal Exhibition of Barcelona, 1926, which latter body has offered use of the fine buildings now being erected in that city for the congress and exhibition.

The opening meetings of the congress and the exhibition shall be at Barcelona, which city has made liberal grants toward the expenses, and the closing meetings of the congress will be in Madrid. Wm. A. Lippincott, secretary.

Secrets of Expert Exhibitors

And Easy Lessons in Judging

By FRANK HECK

THE time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest faker and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system of so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! Don't put off sending your order. You need the book NOW. The price of the book is, including postage.....

marking fowls. Management: Advertising, selling methods, marketing, caponizing, by-products of the poultry flock, including the preservation and uses of manure, feathers, and so on; shipping instructions, preparing birds for exhibitions, preserving eggs, killing and dressing poultry, practical study of the formation of eggs, embryology, measures that prevent mortality among chicks, broiler raising, importance of good business methods. **Equipment:** Working plans and instructions on how to make all kinds of poultry appliances, self-rising doors, ventilators, catching coops, broody hen boxes, trapnests, fattening pens, egg candlers, feed hoppers, erecting poultry netting, racks for sprouting oats, hatching egg cabinets, electric egg tester, outdoor incubator, colony brooders, feeding frames, etc. **Commercial Poultry Raising**, in fact, is an encyclopedia brought right down to date. A copy should be in the hands of everyone who wants to make a profit from hens.

PARTIAL LIST OF CONTENTS

American Poultry Industry: Origin of domestic fowls, magnitude of the industry, tables showing the numbers and kinds of fowls raised in different states, export trade, average prices on poultry and eggs in leading markets for past twenty years. **Analysis of Standard Breeds:** Description of each variety, not alone from the fancier's standpoint but according to utility qualifications, including sixty pen drawings of ideal types by a leading poultry artist. **Companions of the Hen:** Special chapters on ducks, geese, turkeys, guinea fowls, and pigeons, care and feeding, market value. **Incubation and Brooding:** Natural and artificial methods, how to choose equipment, incubator management, selection of hatching eggs, fertility, baby chick industry, sitting hens, testing eggs, how to build incubator cellars and brooder houses. **Poultry House Construction:** Designs for all kinds of buildings, laying houses, colony houses, brood coops, curtain-front and open-front houses, interior fixtures, nests, perches, watering systems, labor-saving devices. **Feeding:** Analysis of foodstuffs of every description, how to compound rations for poultry of all ages and for all purposes, formulas recommended by leading authorities, feed hoppers, mixers, carriers, methods of distribution, records, storage bins, costs, forced feeding, fattening, sprouting oats. **Diseases:** Symptoms and causes of all common ailments, remedies, with special references to white diarrhea, worms, and vermin, how to make disinfectants and dusting powders: Five chapters are devoted to the treatment of diseases. This is a treatise in itself. **Breeding:** Management of stock for increased egg production, selecting males, trapnesting, hybrids, pelvic-bone tests, prepotency, capacities of hens, pedigree breeding.

AMERICAN POULTRY JOURNAL

523 Plymouth Court, Chicago, Illinois

Your Last Chance For Premium List, Coliseum Show, Chicago

The List is ready now and free to you. Entries close Nov. 15th. Dates of show, Dec. 5, 6, 7, 8, 9 and 10, with all of Dec. 4th to get in. Judging will start promptly Dec. 5th.

The Coliseum show has introduced more new and useful features than all other national shows in America combined, and this year we are taking a step that no other association has ever dared to consider in comparison show.

THE JUDGE IN EVERY POULTRY CLASS WILL ISSUE AN INDEX CARD ON EVERY NON-WINNING SINGLE ENTRY AND PEN. This will not be a score card, but an INDEX card that gives the good as well as the bad features of all loosing specimens.

Yes, we know all about the cost and the labor, but we believe the exhibitor is entitled to this information, and we learned a long time ago that it is the exhibitors that make the show.

Yes, we have Rabbits, Savies and Cats and the National meeting of their clubs. OUR EDUCATIONAL PROGRAM is the best ever offered and will be under the direct management of Professor A. G. Phillips of Purdue University, who has called to assist him in this work Professors Card and Kent.

THE UTILITY CLASS WILL BE CONTINUED, and we hope to see it one of the real features.

YES, WE ISSUE A MARKED CATALOG (One edition only). This Catalog is mailed direct from the show to all orders before it is offered for sale on the floor of the show room. This Catalog gives the correct name and address of every exhibitor, with a correct list of all winnings. The price of this catalog is 50 cents per single copy, or five copies to one address for \$2. Remember only one edition of this marked catalog, so order early.

Remember we are not mind readers, and do not know who wants our free list unless you write for it, but if you will send us your name and address we will mail you one under first-class postage.

YES, we are on the same dates as the great International stock show.

ADDRESS OF SECRETARY

The address of the Secretary until Nov. 8th, No. 25 West Washington St., Indianapolis, Ind. After Nov. 8th, Lexington Hotel, Chicago, Ill. The Lexington Hotel, 22nd St. and Michigan boulevard, will be headquarters for the judges and exhibitors. For premium list, or any other information in regard to the show, write the Secretary.

Theo. Hewes, Sec'y.

Where Quality Counts--- PHILADELPHIA SHOW DECEMBER 19-23, 1922

We have the largest exhibition hall in the World where entire show will be cooped single tier and with wide aisles. Nowhere else could your exhibits be shown to better advantage.

Poultry Show Dates

For rules under which shows are held, and for lists of prizes offered and entry fees charged for the exhibition of birds, address the secretary of the show and ask for a free copy of the premium list and entry blank. The name of each secretary is listed with that of the show, and his address is the town or city in which the show is held, unless otherwise stated.

Our list of shows, is compiled from information received from secretaries or judges. If the dates of any poultry show in which you are interested do not appear hereunder, kindly have the secretary mail the necessary information to us and same will be published in our next issue without charge.

Stop Hatching Weak Chicks With Cheap Incubators

Remember, it is not how many you hatch out that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Strong, Healthy Chicks That Live and Grow

We receive many letters such as the following from one of our Illinois dealers:

"We have handled the Queen Incubators and Brooders for the past ten years, selling our first machine February 28th, 1912, and up to the present time we have disposed of 226 machines, all of which are giving the best of satisfaction, even to quite a number of the older ones which are still in service."

Start Your Chicks

with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatches years after the cheap machines have been junked. Sold by dealers. Catalog sent on request.

New Way of Hatching Makes More Money!

Mr. J. R. Singleton of Alba, Texas wrote us that he made \$404.11 profit from one medium sized Porter SOFT-HEAT Incubator in about 4 months; he sold 250 baby chicks, 200 broilers and had besides, 250 pullets and 120 cockerels.

Porter SOFT-HEAT Incubator

BEATS THE HEN

"It is so much better than a hen to hatch chickens that I never intend to set hens any more" is what Mr. Singleton writes further, also that he had no previous experience with incubators, but tried one other make along with his Soft-Heat and that SOFT-HEAT hatched one third more chicks than the other machine.

From Canada to Florida, from coast to coast and in foreign countries users of Soft-Heat are verifying all we claim.

Center Heat Circulated Steam lamp eliminated, saving space and weight. Radiation from above in round egg chamber, like hen's nest, heats every egg evenly.

Saves 300% in time, money and labor. Less than 1 gal. of oil—one filling—to hatch. Others burn 4 to 6 gallon.

2 Minutes Daily is all the care a Soft-Heat requires. Eggs turned semi-automatically, without removing or lifting tray. Children get same good results as experts with Soft-Heat.

Free Book

Illustrated. Tells reasons for amazing success of Soft-Heat, gives users' testimony, shows how you can make money with a Porter. Send post card for free copy TODAY.

GOOD TABLE POULTRY

By WILLARD C. THOMPSON

One of the most interesting phases of the development of the poultry industry in America has been found in the formation and building of the several breeds and varieties of fowls which now are established as pure breeds, and which offer to the rank and file of poultry keepers widest of selection, satisfying every personal whim or fancy. The rapid and really phenomenal growth of these pure breeds speaks volumes for the ability and initiative of the American poultryman. We have learned very generally the lesson that greatest profits and more permanent business depends upon the selection and maintenance of the pure-bred flock. And yet the end is not yet! Practically every year new breeds and varieties are brought to the attention of the public, and new bids are made for popular favor among people who are chicken enthusiasts. And the most of our American people are this, more or less. But we are living in a time when it becomes increasingly hard to put forward a new breed or variety, and have it accepted. We already have so many. Yes, we have, and still there is undoubtedly always a bit of room for a real contribution. Therefore, the newcomers of this day when accepted must have passed an acid test, as it were.

A History Made in a General Farming Section

It is interesting and important to realize that many of our most important poultry pure breeds have been developed as the result of an insistent public demand for a certain type of fowl. Back almost a generation now the American general farm began to desire a general purpose fowl that would lay well and yet at the same time provide a good meat carcass for the Sunday dinner table. The response to this demand has been noteworthy, for the whole American class, including Plymouth Rocks, Rhode Island Reds, Wyandottes, Buckeyes, Dominiques, and Javas, has resulted. And within each two or more varieties, except in the Dominique. The thousands of farm flocks have had their dual-purpose fowl, with yellow skin, good flesh, brown egg, etc., made to order. In other cases the specialist, the egg hen, has come forth. And then in other cases the heavy old meat producer.

During the past several years down in the central farming section of New Jersey, an area noted for its thrifty farmers and its productive soils, the farming people, notably the farmers' wives, have been raising black hens. For the general farm, where the poultry flock is but a comparatively small unit of the farm work and business, and where the fowls have free range and take care

of themselves to a great extent, there is a certain advantage in a black colored fowl. But these New Jersey farmers have developed their black fowl, not so much, probably, because of this demand for a dark plumaged bird for general use, but rather as a natural result of the breeding which has produced the breed, and a certain defined tendency to select the even, uniformly black individuals each breeding season. At any rate, the Jersey Giant is black. These farmers have for many years been breeding these black fowls, not always systematically and cooperatively, but nevertheless vigorously. Today they may be seen throughout that farming section in central New Jersey, and the present day finds them creeping into every corner of that state, and even into every section of the country that loves a worth-while hen.

The present pure-bred Jersey Black Giant is the product of two inheritances, on the one hand the background of those farms referred to above, contributing vigor, vitality, size, hardiness, ability to put on economical flesh, and other valuable attributes possessed, and on the other hand a fine polishing at the hands of several well-known and competent poultry breeders, who have interested themselves and applied their knowledge toward the perfecting and standardizing of the popular bird. The breed is fortunate in that it has had these two sources of inheritance, for from both it has been wonderfully blessed. And because of the interest of both it cannot but hold an unique and favorable place among American fowls.

The years through which this breed has been developing have built for it certain characteristics:

Hardiness is a term which the poultry raiser understands to mean as a sign of strength. A hardy chick grows strong, rapidly, without retarded spells. A hardy fowl eats well, lives well, and is cared for and handled with comparative ease. Hardiness, as a virtue in a breed of fowls, adapts it to the use of many. Hardiness points away from delicacy, away from weakness, and always toward health and vigor.

Vigor is a bit different from the previous term. Vigor is an in-bred strength and vitality. It is an inheritance of resistance to disease and a bequest that tends to insure health.

Size is a desirable trait in any fowl that aims to satisfy the demand of people for poultry meat in the form of roasting fowls, or capons. It is perhaps over-emphasized at times, but nevertheless size is and has been a characteristic of the Jersey Black Giant. If a fowl of considerable size is to meet with favor it must attain this size economically and profitably, and that means rapid growth. Size which is attained only

Imperial "Ringlet" Barred Plymouth Rock male, owned and bred by E. B. Thompson, Amenia, New York

after long feeding and many months of care is expensive. The Giant is a large bird, and it is to be expected that it will require more time in which to grow and develop than a fowl a third its size, but it is the end product which measures the worth-whileness of it all. Size must be attained without securing awkwardness and lack of proportions.

Economical development often determines whether or not raising a certain breed of fowls pay. The Giant could not have stood the critical test of the central Jersey farmers for so many years, if it had not been a bird which made economical growth development, if it had not reached maturity, worth more than it cost to produce. The Giant does eat a lot of food, it should, but if it returns profit on grain consumed all is well, and it certainly does.

Yellow skin is a market requirement peculiar to America. The foreign markets all want a white skin. But we do not. We want it yellow. And the Giant is yellow skinned. Its carcass, dressed for the use of the housewife, is golden.

Black plumage is a universal favorite. Even among those poultrymen who are primarily interested in fowls other than black evidence a distinct admiration for a shiny, glossy, black plumage, in which the green sheen is a mark of worth, and the purple is conspicuous by its absence.

Egg production is desired ever in the largest of fowls. The farmer's wife will have little use for the general purpose fowl or the meat fowl which does not lay a godly number of eggs. The Giant is undoubtedly well equipped in this regard. The breeders tell us this is true. The writer has seen it proven when visiting its haunts and homes. And winter eggs! The farm home and the wise poultry breeder are equally responsible for the effect produced. Both should and will work together, each interested in the worthy fowl for its real value as an American-made product.

Using the Jersey Black Giant

When a new pure breed comes before so vast an industry as the American poultry industry for recognition on its merit it must make clear its field of usefulness. In this case such an answer may perhaps well be found in those poultry flocks wherein the Giant has entered. The Jersey Black Giant is distinctly serving a very definite usefulness on many farms in New Jersey, its native state, as well as elsewhere.

As a general purpose breed the Giant is furnishing a medium sized fowl that fits the needs of the general farmer, who desires a dual purpose type of farm fowl, but who has been converted to the added value of having a pure breed. The Giant lays well, especially during the cold months. The Giant furnishes splendid carcasses for the farmer's table. When kept in relatively small flocks for the satisfaction of the immediate needs of the family it poves its efficiency.

Many a Jersey farmer, or really his wife, has found in the Giant a remarkable fowl for caponizing. On a farm recently visited by the writer the farmer's wife had sold over 200 Giant capons during the past early spring. And these at nearly 60 cents a pound, and the least had weighed ten pounds. Do a little figuring, and see why she had some spending money, or savings money.

The Giant roaster is marketed in great numbers where for one reason or another the practice of caponizing has not been developed.

It is interesting and important to realize that the Giant is being adopted as a second breed on many a poultry plant. On Leghorn egg farms better balance of income from month to month is found by adopting a fowl of the Giant's type. On many a farm where other and very worthy general purpose breeds are or have been kept exclusively the Giant is found.

The poultry breeder finds in the Giant a wonder with which to work, a fowl much in demand, and a joy in the show room.

There are many ways in which the Giant is used.

Caponizing

During June thousands of Jersey Black Giant cockerels will be caponized. The

INTRODUCING GEO. C. ENGLAND'S Southern California Single Comb White Leghorns *Pedigreed and Trapnested Since 1912*

Ten long years of hard work, scientific breeding and careful study of which is best and which is not best has enabled me to produce a strain of S. C. White Leghorns that will meet the demand, not for 300 egg records alone, but birds of long distance laying. My ambition has been to produce a hen that will lay 200 or more eggs in her pullet year (twelve months from first egg) and 200 eggs for her second year also. And we have several that have laid 200 eggs in their third year. These hens have never failed to produce a good shelled chalk white hatchable egg.

MY POLICY

has always been to produce the goods, and then

TELL THE WORLD ABOUT IT

We trapnest 2,000 pullets every day in the year beginning with their first egg, as well as every hen that lays 200 eggs or more.

We have for sale for immediate shipment cocks, hens and cockerels that will please you.

Perhaps you will want to know who I am. If you do, write to the editor of this journal, or let me send you the names of prominent poultrymen and judges. Better still, write the First National Bank or any other bank or banker in Inglewood.

capon finds a ready market. Its flesh is tender, juicy, and well flavored. Its production can be accomplished economically and with profit, especially where fields are plenty and range afforded for the long summer period of growth and development. Capon production can well be considered by the general farmer as a profitable means of disposing of the surplus cockerels. In order that the caponizing of Giants or any other heavy breed cockerels may be successful and economical, there are one or two points that seem appropriate to consider just at this time.

The cockerel should be caponized when weighing between one and one-half pounds and one and three-quarters pounds. The writer has found the operation easier to perform at that stage, and the chances for danger less, and the birds to do better when worked on at that stage of growth. This will bring a great deal of the work of caponizing into the month of June probably.

The cockerels that are to be developed into market capons should be early hatched. Many poultry producers have failed to realize as much profit as might be accrued because of late hatching of stock that was to be caponized. March should see the Giant chicks hatched, or April at latest. This will throw the caponizing into June usually.

June, because of usually naturally fine weather prevailing at that time in most sections, is a favorable time in which to operate. The little capons recover quicker and suffer little or no setback of which there is danger when caponizing is done in hottest weather.

Starve, withholding both food and water, for about forty hours before performing the operation. This is not cruelty, as the chicks do not suffer. They get hungry, of course, but no harm is done. They should be kept cool during this period. The intestines, if empty when the caponizing is done, fall back out of the way, and hasten the operation materially.

Secure good reliable instruments, and have them sharp. Secure a barrel to which to fasten the bird on its side. Operate from one side only. Make the cuts quick, clean and carefully. Work fast, but carefully. Liberate the chick as soon as possible. Put him back into a cool place and give water and a little soft food.

Watch for windpuffs, piercing them to allow escape of air.

Do the operation antiseptically, avoiding any possible infection.

Carry the capons through the summer on green pasture, feeding as for normal growth and development.

About next holiday season finish them for the fancy market.

Prizes at Poultry Shows

D. Lincoln Orr of the New York show, who always does things in a big way, announces a single prize of \$250 in cash to the exhibitor having what is adjudged by a jury of three judges as the best exhibition pen at the forthcoming Madison Square Garden show.

Since Mr. Orr has assumed the management of the Garden poultry show, the display coops of birds in slattern condition from commercial egg farms, have been absent from the main floor of the great arena. Mr. Orr maintains that the prestige and buying power of the New York show belong to the breeders of good Standard poultry, who make the show possible. He is out to encourage the good breeders. More power to him.

Cages on the lower level of the Garden are rented to exhibitors who wish to put utility birds on display. Mr. Orr censors the advertising on those cages pretty severely. No utility classes are opened for competition at the Garden, and a first prize at New York means exactly "first prize," for it can be won only in the Standard exhibition class.

A pair of pigeons will consume about 100 lbs. of feed in a year—in other words, one pigeon will eat about half as much feed as one hen.

Classified Advertisements

Under this heading ads will be inserted for eighteen cents per word each month for less than three months, or forty-five cents per word for three months. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under classified headings. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from American Poultry Journal than from any other poultry journal—none excepted. On writing any of these advertisers, mention American Poultry Journal. All copy for Classified Ads must reach us by the 17th of month preceding date of issue. These rates void after May 20th, 1923.

SMITH'S SINGLE COMB Buff Leghorns, the largest breeder of Buffs in the world. I have no other breeds. Winners at twenty of the biggest winter shows and government egg laying contest at Leavenworth, Kan. Out of fifty-four firsts at the three big State fairs in Ohio, Indiana and Kentucky. I won forty-one in 1920-21-22, and the Sweepstakes Special this year on cockerel, the best bird in the show against all breeds, at Columbus. At the above three shows the Buff Leghorn was one of the largest classes. Six thousand grand birds for sale at living prices from my best bred to lay stock and line breed birds with best blood lines back of them for eggs with grand color and fine type. If you want the best I can please you better than small breeders with small flocks. Free catalog. Order at once. F. S. Smith, boxes C & D, Hamilton, Ohio, president of American Buff Leghorn club. Send \$1.50 and join the club. 10

Oak Dale Farm's S. C. White Leghorns

Successor to D. W. Young and Owen Farms S. C. White Leghorns

"WON ALL PRIZES COMPETED FOR"---

from New York State, Oct. 5th.

"Won first and second pullet on the two pullets you sent me"—from Ill., Sept. 20.

"Won Champion Cockerel on Oak Dale Edward 115th"—from Kans., Oct. 2d.

"Won Best cockerel in entire show and \$50 Silver Cup"—from Ohio, Sept. 18th.

"The cockerel and pullets are the best birds of their age I have ever seen"—from Georgia, June 10th.

LAMON—"The Master Breeder"

Your order filled to your entire satisfaction is my personal guarantee.

Harry M. Lamon

"Got the first pullet egg from the birds you sent me Aug. 8th. The birds are admired by all who see them"—from New York State, Aug. 19th.

It is with keen delight that the owners of Oak Dale Farm present the above quotations from letters received on the dates indicated from Kansas on the west, New York State on the east, Georgia to the south. We wish to publicly credit Harry M. Lamon, manager of Oak Dale Farm, for producing the hundreds of "star" youngsters bred on Oak Dale during the 1922 breeding season. When we searched the English speaking poultry world to find a "Master Breeder"—an heir to the mantle of

D. W. Young—we were fortunate in securing the one man best fitted to carry out, along the identical path, the breeding work originated by Mr. Young, the founder of the "World-Famous D. W. Young Strain," whose undefeated flock we purchased in its entirety. This flock has been line-bred each year since its purchase. This year the matings were by Mr. Lamon. The sensational youngsters on Oak Dale Farm are, in truth, Mr. Lamon's own handiwork. And they are, without question, the

Greatest Quality Lot, Nearest Perfect Types with Most Immaculate White Color Oak Dale Has Ever Bred

WINNERS

Exhibition Cockerels and Pullets—ready to win any show in the U. S. Show birds washed, groomed, trained—all ready to capture the first prizes and specials for you, at prices which will surprise you.

Sit right down and write for Oak Dale's Fall Catalogue—recently off the press—and read:

1. Why is the Oak Dale Flock Supreme?
2. Why did Oak Dale Farm Purchase the Two Highest Priced Flocks of S. C. White Leghorns in the world?
3. \$4.30 Per Hen.
4. A Story Without Words.
5. The Proof!

In the catalogue you will find a "Confidential Information Blank." Get one! Take advantage of your opportunity. This service is free of charge. Let Lamon—"The Master Breeder"—help you.

EGGS

Is the D. W. Young Strain a heavy-laying strain? If you have any doubts turn to pages 3, 4 and 5 of Oak Dale's Fall Catalog, and read the evidence, and judge for yourself. Think of a prize-winning, over 280-egg hen that with her daughters produced 167 pullets, 67 per cent of which laid.

200 Eggs or Over!

Oak Dale's 1922 Pullets are proving especially prolific layers—real exhibition types with eggs "Bred In" them, and they can't help shell them out. Read what a Canadian breeder wrote:

"82 Lansdowne St., Peterboro, Ont., Canada.
August 31, 1922.

Dear Sir: On June 22nd I sent you an order for 3 cockerels, 10 weeks old, and 3 pullets, 8 weeks old. One of these pullets has laid 4 eggs already, commencing on Sunday, August 27th, just skipping one day so far, which appears to me a bit extraordinary, as this pullet is of exhibition type. Will be ordering some exhibition type chicks or eggs in the spring from you. Thanking you for past favors, I am, respectfully yours,

"JNO. H. DAVIS."

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship, Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

**Supreme at Madison Square Garden
Is Supreme Everywhere**

More Prizes and Silver Cups

have been won by IMPERIAL "RINGLETS" in the hands of my customers throughout America and the World than by any other line or strain.

I believe the most prominent breeders everywhere are using IMPERIAL "RINGLET" blood to improve their stock—THIS MEANS SOMETHING—IMPERIAL "RINGLETS" are the standard for all the Barred Rocks in all America and if you want the BEST you should have my IMPERIAL "RINGLETS."

Grand Winning Show Birds

The finest ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition. Cocks, cockerels, hens, pullets and pens. Their matchless "Ringlet" barring wins under all judges—As layers they stand pre-eminent—QUALITY COUNTS—I assume that you want the best Barred Rocks obtainable.

Elegant catalogue mailed on request.

Prices reasonable.

GREETINGS

Fifteen Cents Per Copy

**Stark Tree Orchard of
C. L. Witherell, at
Middlebury, Vt.—
3500 Stark
Delicious
Trees**

**← Average Size Stark
Delicious, Grown
on a Genuine
ORIGINAL
TREE
Strain
Tree**

**74 Stark Trees = 576 Bu.
Apples = \$2,460.00 in
Year on Vermont Farm!**

C. L. Witherell bought the land where his orchard now stands (near Middlebury, in Northern Vermont) for \$40 an acre. It would have made him a scant living in corn, wheat or ordinary farm crops.

Last year, 74 of his 11-year-old Stark Delicious trees yielded him 576 bushels of glorious apples. And—they added the impressive sum of Two Thousand Four Hundred and Sixty Dollars to his bank account.

He tells us that his Stark Delicious began bearing when 4 years old—and have borne every year since. He now has 1,000 more Stark Delicious 6-yr.-old that he declares "Will produce a bumper crop this year." On October 21, 1922, he writes: "Just shipped last car Stark Delicious to New York. Got \$6.00 per box for run of Delicious. Special Fancy \$8.00 per box."

We wish that every fruit grower—every farmer—and every home-owner could see and talk to Mr. C. L. Witherell.

YOU would know then WHY—

ORIGINAL TREE Strain of—Stark Delicious—Sold Only by STARK BRO'S

Bears Wondrous Money-Crops in 44 Out of 48 States!

Monument Dedicated to ORIGINAL Stark Delicious Tree, Aug. 1922, by State of Iowa

Go into almost any state you wish and you'll see Prosperity sitting on the front door step of growers who have planted **ORIGINAL TREE Strain of Stark Delicious.**

Near Fitchburg, Mass., A. A. Marshall is getting wondrous crops and record-prices (\$7.00 for 75 Delicious apples in a carton) for his harvests from his 6,000 tree orchard. His 8 and 9-year-old **ORIGINAL TREE Strain of Stark Delicious** trees bore about 20 bushels each this past summer.

E. F. Thayer, Chelan Co., Wash., a former accountant, who banked \$90,350 for his Stark Delicious, Winesaps and Jonathans off 23 acres in 4 years. He

writes:—"If I were planting a new orchard, I would make it **all ORIGINAL TREE Strain of Stark Delicious.**"

In Clermont Co., Ohio, J. J. Bohlender has enjoyed a **NET** income of \$21,800.00 in 6 years off 12 to 20 acres, **ORIGINAL TREE Strain of Stark Delicious** apples, being his prize-price makers.

Again, in Sullivan Co., New York, Chas. Taylor has specialized on Stark Delicious and made 5 acres of common \$40 an acre land bring him over \$9,200.00 in last 5 of the short 10 years he has been an apple grower. He says, "Once people buy genuine Stark Delicious apples they don't want any other kind."

Investigate this remarkable apple tree—**WRITE FOR THE BIG, 80-PAGE, 4-COLOR MASTERPIECE 1923 CATALOG. USE THE COUPON.** Learn, too, about—

Stark's Golden Delicious

It is to be the apple sensation of the century.

Chas. Riedenbaker, Burlington Co., N. J. says:—"The best apple grown." ALL his 250 Stark's Golden Delicious, 3rd summer, bore big crops this year (1922). One yielded 80 apples. Many bore when only 13 months. "Very large and fine color."

And Prof. Paddock, Ohio's noted State Horticulturist, frankly admits, "Stark's Golden Delicious beats anything I ever saw."

Get all the facts—**SEND COUPON for FREE Copy of Big, 80-Page, 1923 "Prize Fruits" Book.**

Stark Seed "Bore Heavy Vegetable Crops" "This drouth ruined all crops around here, but our vegetable garden—planted with Stark Seeds—weathered it well and bore heavy, all through the dry season," writes Mr. Ulrich Southheimer, Rushland, Penn.

Our Big 64-page Edition of Stark Bro's 1923 Vegetable and Flower Seed Catalog is now ready. **SEND COUPON for FREE Copy.**

INTERNATIONAL HEADQUARTERS "ARISTOCRAT" BARRED ROCKS

The World's Greatest Strain of Poultry

The
Great
Money Makers

Supreme as
SHOWBIRDS

Supreme as
LAYERS

Supreme as
MARKET FOWL

Prize-Winning Showbirds

The famous Aristocrat Barred Rocks have created a new WORLD'S RECORD by their sensational sweep of victories in thousands of showrooms, including the largest and biggest Barred Rock shows of the entire world. The NATIONAL B. R. CLUB SHOW (the greatest of all the great ones), CHICAGO, "HEART-OF-AMERICA," BOSTON, N. Y. PALACE, GUELPH, DALLAS, LOS ANGELES, "TRI-STATE," BROOKLYN, CLEVELAND, NEW ORLEANS, ST. LOUIS, NEW YORK STATE, HOUSTON, WINNIPEG, PITTSBURGH, INDIANAPOLIS, MINNEAPOLIS, SAN FRANCISCO, DETROIT, etc., etc., hail the Aristocrats as winners! MY CUSTOMERS ARE WINNING OUT WITH "ARISTOCRATS" ALL OVER THE WORLD.

Record Layers

The same magnificent showbirds are equally supreme as layers. THREE HUNDRED SIXTY-ONE (361) EGGS FROM ONE MOLT TO THE NEXT BY AN "ARISTOCRAT" HEN IS UNDOUBTEDLY THE LAYING RECORD OF THE WORLD. Equally matchless is the record of 260 eggs in 270 consecutive days by another "Aristocrat" hen. An average of 240 eggs per hen by a complete pen of "Aristocrats" may appeal to you even more. Many "Aristocrat" cockerels from my great laying record hens have been sold to State Agricultural Colleges. Can better evidence of their value be given?

Guaranteed Prize Winners Now Ready

GRANDER, RICHER QUALITY THAN EVER BEFORE. SURE WINNERS. Remember, winning in the showroom will create big money sales for you. Absolute satisfaction guaranteed in every Aristocrat showbird. These Aristocrat showbirds are so surpassingly beautiful that you cannot even picture to yourself their glorious beauty until you actually see them before you. If you need real prize-winners simply write me.

Why not breed beautiful Prize-Winning Showbirds, Great Record Layers and the most Delicious Table Fowl—ALL COMBINED IN ONE? It costs no more to raise such birds than ordinary poultry.

ARISTOCRAT EGG ORDERS are being booked now for immediate and for later delivery at the following prices: \$15 per 15; \$25 per 30; \$40 for 50; \$75 for 100. THESE ARE ABSOLUTELY THE BEST BARRED ROCK EGGS THAT MONEY CAN BUY. Orders booked ahead if one-fourth of the total price is sent in. Grand new catalog and special showbird offering free.

Remember, Holterman is the man who is furnishing to other breeders so many of those powerful winners in the world's foremost shows.

My Buff Orpingtons

Perhaps no line of Buffs in existence carries the purity of color now possessed by my Strain. By this I refer to the strength of undercolor in every section, the soundness in tail and wing color, the soft, even, level surface color of Females and the brilliant, sparkling, golden luster in Males. But this matchless excellence of color does not make a complete Orpington. I have always maintained and cautiously guarded massive proportions, large capacity, broadness with length, stout bone, proper station, neat head points and good length of feather. These balanced color and type qualities in my best Buff Orpingtons are the fruits of my 21 years of constructive and most cautious breeding. This matchless achievement accounts for my unapproached sensational winnings at the Great Chicago Coliseum Show past four years as well as my ability to serve you best in Buff Orpingtons

Note:—Because of my total Winnings by overwhelming majority in Buff Orpingtons past four consecutive years at the Chicago Coliseum I will not compete at this show this season. This enables me to furnish dozens of fresh outstanding exhibition Stars for any competition anywhere during December and January. Likewise in White and Black Orpingtons.

My White and Black Orpingtons

While I do not breed White and Black Orpingtons so extensively as Buffs, the very same basic principles of constructive breeding is utilized and I have quietly furnished many of the most sensational Winners in White and Black Orpingtons known to the American Orpington fancy. Prudent purchasers do not object to paying substantial prices when they get this quality and the

finest of my many years of breeding are now open to your purchase. My outstanding specimens this year carry the neatest head points, the greatest capacity, the broadest backs, the lowest tail carriage, the fullest breasts, the heaviest bone and the best station that I ever owned! My old customers everywhere will fully appreciate this news and will order early as usual.

In every single instance the quality will over-balance the price whether the price be \$5 or \$50 per bird and your complete satisfaction is guaranteed.

C. S. BYERS

Successful Orpington
Specialist 21 Years

HAZELRIGG, IND.

Play Safe! Start This Season with The Schwalge Incubator

No other machine regardless of name or price will give you such high satisfaction as the Schwalge

"Four In One" 800-Egg Section

Prove This for Yourself

by taking off a free trial hatch as explained in our guarantee (see catalogue).

Our "Four In One" is a BABY MAMMOTH. Has FOUR complete incubators IN ONE section and heated with one heater. With this one section a hatch can be taken off every week or you can set FOUR different kinds of eggs at one time.

You can start with one "Four In One" 800 egg section and increase the capacity section by section, to a mammoth machine.

Distinctive Features of the 1923 Schwalge Incubator

FOUR INCUBATORS IN ONE. Each egg chamber is a separate unit holding 200 eggs. Any chamber not in use may be shut off by means of a stop-off damper. This makes it especially practical for CUSTOM HATCHING.

HEAT UNDER ABSOLUTE CONTROL, uniform and steady throughout the hatching period. The heat travels through 4-inch heating tubes and is controlled before (not after) it reaches the egg chamber. The very uniform temperature in all egg chambers has won for the Schwalge an unexcelled reputation.

VENTILATION. The efficient ventilation system is independent of the heating arrangement, easily regulated and adaptable to any climate.

MOISTURE. The drying-out process of the eggs during the hatching period is greatly retarded in our machine, which preserves the necessary moisture

within the egg. For this reason our incubator can be operated without supplying additional moisture in localities where other machines would be a complete failure. In high altitudes or dry climates moisture can be supplied through the top of the machine in the most sanitary and efficient manner.

MECHANICAL EGG TURNING DEVICE, which gives every egg the desired half turn. One simple movement of the lever turns every egg. Can easily be removed, if turning by hand is preferred.

HIGH-GRADE CONSTRUCTION. Sound lumber, mostly redwood, 28 gauge galvanized iron and a liberal amount of asbestos are used in the construction. It is packed well to hold the heat very steady.

SECTIONAL CONSTRUCTION. It takes only a few minutes to add sections and can be done even while the preceding sections are in use.

Enlarged to 9600 Egg Capacity [12 "Four in One" Sections]

You should buy the Schwalge Incubator because it has the strongest guarantee back of it, which eliminates all risk.

PARKS' Bred-to-Lay BARRED PLYMOUTH ROCK Cockerels

Will stamp the lay on your flock as they have for thousands of other progressive breeders the World Over. Prof. Lippincott, Kans. Exp. Sta., reports over 94% increase.

I got a cockerel from you two years ago and has made my flock the best Barred Rock Layers around here. G. M. Andrews, Box 90, McKnightstown, Pa.

I am well pleased with the cock bird you sent me a year ago. I have sold from him \$260.00 in hatching eggs and young stock and have 25 pullets that are of good markings and good egg type. Art. Wilson, Bay City, Texas.

Cockerel bought from you sired some fine pullets for me. Some of them having monthly records as high as 28 eggs for Dec. F. C. Crawford, 210 S. Alves St., Henderson, Ky.

I think it only fair to tell you I have the finest lot of Barred Rocks I ever raised and I have raised Rocks for fourteen years. I blame it all on the cockerel bought of you. Mrs. Alva Chestnut, Newton, Ill., R. No. 8.

Head Your Pens with males from America's Oldest and Greatest Laying strain that have made and hold about all the World's Rock Laying Records.

16-page Stock Circular
be worth dollars to them.

The fine cock bought of you for Club member is in the pen that won the State record. The young lady who got him received a trip to Washington as prize for her poultry record. Miss See Rice, Sardis, Miss.

I had 35 pullets from the cockerel I bought of you that commenced to lay at four months and 1 day and the first year they averaged 198 eggs and they layed 781 days with only one break.
John D. Pingree, New London, N. H.

I have records up to 226 eggs from pullets sired by your cock-
erels and flock averages up to 187 eggs in one year for flocks
of 200 birds. H. G. Blaisdell, Kenduskeag, Me.

The cockerel is a wonder. Chucked full of pep. A well known expert here remarked, You had to take your hat off to Parks.
A. A. Lees, Hamilton, Ont., Can.

Wyckoff's S. C. White Leghorns

America's Business Hen

Their 42nd Year of Direct Breeding and Improvement

Acknowledged everywhere as the world's greatest laying strain—unequaled in standard qualities.

SPECIAL ATTENTION is directed to the fact that it has been proven, on careful investigation, that the world's greatest record flocks of high quality Leghorns have a foundation wholly, or in part, of this famous strain. Conclusive proof that they are THE GOLD STANDARD OF S. C. WHITE LEGHORN VALUE.

BREEDING COCKERELS

A wonderful lot of strong, vigorous, healthy, range-reared cockerels, all produced from a special selected lot of three year old hens representative of our highest quality. The blood lines you need to double the value of your next season's breeding pens.

Send for free descriptive catalog with numerous photographic illustrations of this most completely equipped plant, and Special Illustrated Cockerel Circular giving description of the different grades, with prices—prices that are most exceptionally low, when quality is considered. Place your orders at headquarters and get the best.

(The Man Who Delivers the Goods)

R4, DECORAH, IOWA

Patriot BREEDING BARRED PLYMOUTH ROCKS

Again prove their superiority by making the following OFFICIAL records at the Canadian International Egg Laying Contest. Ten birds laid 2118 eggs or an average of 211.8 eggs per bird per year. High individuals, 271, 261, 230 eggs per year.

Place your orders early for Breeding Stock, Chicks and hatching eggs.
THE FERGUSON FARMS, Dept. A, DYERSBURG, TENN.

*Easier to operate
than a clock!*

*This is the way
to healthier, more livable chicks—*

How much money are you going to make with your baby chicks? It all depends on the efficiency of your Brooder. Do you realize that? If you do, you will buy the Wishbone Valveless Oil Brooder, which will care for your chicks better than Mother Hen herself. And it won't give you a moment's worry or trouble all season.

The Wishbone Valveless ~ Blue Flame **BROODER**

is 100% practical. There are no valves to stick—no strainers to clog—no thermostats to go wrong. There's no priming—no pre-heating. You simply touch a match to the burner, and a powerful blue flame shoots right up. That is all there is to it. The oil is bound to flow continuously and regularly. All you have to do is to refill the one gallon reservoir occasionally.

The Wishbone Valveless is economical to operate. Its original cost is low. It requires comparatively little fuel because it uses every available heat unit—and keeps the heat where the chicks need it.

The Wishbone Valveless is trouble proof! There's nothing to get out of order—nothing to go wrong. The chicks are guaranteed a comfortable heat and a steady supply of fresh air.

It is vastly superior to any other brooder ever invented—far cleaner and more convenient than the cumbersome coal-burner. With the almost universal scarcity of coal, this is a particularly good time to replace your coal-burner with a Wishbone Valveless.

Order Your Wishbone Brooder Today

The sooner you get it, the sooner you will be free of brooder troubles and disturbances. If there is no Wishbone dealer in your neighborhood, send your order direct to us. We will ship at once.

SEND FOR BOOKLET

Send for the free booklet that tells in detail how the Wishbone works, and saves time, trouble and money.

HIGHLAND PARK POULTRY RANCH

FREE RANGE BREEDERS

OF LINE BRED

Trapnested

TANCRED S. C. WHITE LEGHORNS

Pedigreed

Believing that HIGHEST EFFICIENCY as regard breeding and laying qualities DEPENDS PRIMARILY ON VIGOR, this ranch is laid out to give ABSOLUTE FREE RANGE ON KEPT-CLEAN SOIL. The land is constantly ploughed and the birds are regularly changed twice a year to ground on which clover, grass, kale, vetch and oats provide succulent green food. There are No Boundary Fences, only dividing fences.

WE NOW OFFER VIGOROUS, STANDARD TYPE, PURE TANCRED PULLETS AND VIGOROUS COCKERELS FOR SALE

TO START YOU WITH H. P. RANCH LAYERS:

We are also booking advance orders for hatching eggs at the very moderate price of \$30.00 per 50 eggs, from hens with records of 251 to 299 and all males with dam, pullet year records over 300 eggs. Large, snow-white eggs. This ranch has purchased several shipments of eggs from Mr. Tancred each year from selected matings. We ask A. P. J. readers to place orders EARLY for these eggs, thus to avoid disappointment.

Cockerels heading two selected pens are from eggs for which we paid Mr. Tancred \$33.33 each. These eggs were from a pair of birds which Mr. Tancred said were absolutely the finest two specimens he had ever produced. No other breeder was able to get eggs from this mating. These two Cockerels are the finest of the males we hatched from this mating and are of splendid type. One of them will head our best pen of three hens, the most valuable we have ever produced, one of these hens, of vigorous standard type, making an official record in the Western Washington Contest at Puyallup this year of over 280 eggs. We can spare but three sittings of eggs from this mating, at \$100.00 for fifteen eggs.

BREEDING TO TYPE, INCREASING EGG CAPACITY AND CREATING GREATER STAMINA, HIGHLAND PARK POULTRY RANCH SHOWS THE WONDERFUL TANCRED STRAIN AT ITS BEST, FOR ONLY VARIED FREE RANGE CAN DEVELOP A FLOCK'S GREATEST EFFICIENCY.

It's Ready Now — My New Old Trusty Catalog

Harry Johnson
The Incubator Man

Here it is, Reader, my New Old Trusty Catalog, just off the press and every page a money-making opportunity for poultry raisers. I've reserved a copy for you, and if you'll mail me the coupon I'll start it on the way to you by return mail.

Write and get your Old Trusty book at once because the most money will be made from the early hatches. Sell early broilers next summer and let pullets mature into laying form before heavy frosts. Cash in when eggs and dressed poultry prices are at their peak. With an Old Trusty you can control the hatches and always be sure of getting top prices.

This year—as in other years—Old Trusty will be the fastest selling incubator in America. More than a million Johnson machines are used, shelling out high average hatches year in and year out—Winter and Summer—with less work and worry for owners than any other incubator.

Reduced Prices — Quick Shipment

You can't afford to overlook my [money-saving offer on Old Trustys. I am making a big drive for new customers and to do it I've trimmed prices right down to the bone. In Old Trusty you get a machine that is fitted with a pure copper hot water heating plant—clear California Redwood case—strong substantial egg tray slides—improved ventilation and moisture tubes, and other new features. Four handy Old Trusty sizes and each a quality machine all the way through.

Why take chances or experiment with a make-shift and worn out machine when you can get Old Trusty at my 1923 prices—a machine that is a quality proposition and that will more than pay for its cost in the first hatch and keep on piling up profits for you ever after.

You'll find Old Trusty in the hands of the best poultry raisers all over the country. Old Trusty is built in a factory where work-saving methods are employed. The most of our employes have been with us for years. They have the "know how" that puts certainty into hatches and takes all the work and worry, the guess-work out of making money with Old Trustys.

Mail the coupon today—that's the first step toward building up a permanent, profitable poultry income.

Join the Old Trusty Ten-Year Club

Thousands of Old Trusty owners have used Old Trusty ten years or more. All are members of the "Old Trusty Ten-Year Club." Are you? Send me your name.

"Owned my Old Trusty for sixteen years and think there is no better made."—Mrs. Lena Smith, Newkirk, Okla.

"Bought incubator from your father sixteen years ago. Still making good hatches."—H. Stanley, Riverdale, Md.

Here Are Questions You Will Find Answered in My Book

How can I keep hens laying in winter?
How can I pick the money-makers in a flock of pullets?
How can I make poultry raising a business?
What's the best size incubator to buy?
What's the best way to save chicks?
Why do early hatches make the most money?
How can I make an inexpensive poultry house?
What are the best breeds?
What is the best method to preserve eggs?
These are only a few of the subjects treated in my new book—subjects that stand between success and failure.

WORLD'S HEADQUARTERS FOR S. C. Rhode Island Reds

During the past thirteen years more than thirty thousand Standard-bred high producing S. C. R. I. Reds have been produced on Owen Farms. They have gone to thousands of customers in every Continent on the Globe. They have won thousands of prizes in large and small shows all over the world. They have been the foundation blood from which have been built many thousand laying, paying, and winning flocks. They have made crashing victories in the show room where competition was keenest. Starting with best Display and three out of five First prizes at Madison Square Garden in 1911 they have won best Display repeatedly at Madison Square Garden, Boston, New York State Fair, Club Shows at Minneapolis, Kansas City, and Boston, and in the superb class at the Chicago National in January, 1922, they made practically a clean sweep, winning 1st and 2nd Cock; 2nd and 5th Hen; 1st, 2nd and 4th Cockerel; 1st and 2nd Pullet; 1st and 2nd Old Pen; 1st and 4th Young Pen; Best Display; Champion Male and Champion Female, both combs competing.

OWEN FARMS

is devoting 105 acres to the production of S. C. R. I. Reds and Buff Orpingtons under free range conditions. None are crowded. Several hundred are grown each year for me from farmed out eggs by neighboring farmers. All under conditions of unlimited range. It would cost more than \$60,000.00 to duplicate the buildings on Owen Farms. They are ample, sanitary, and complete. Each mated pen has a floor

space of 10'6" by 16'. The organization at the farms and in the office is competent, experienced, and faithful to your interests. "Once an Owen Farms customer, always a customer of Owen Farms" has become a truism and is the slogan of every person connected with the organization. 70% of Owen Farms customers have sent repeat orders. Your satisfaction means my success.

OWEN FARMS COLOR

is even, rich, dark, velvety red with great sheen and brilliancy. It is the color preferred by every Judge who follows the Standard and by all but a very few breeders. Brown or chocolate shades have never been tolerated here and never will be. Every bird is exhibited and sold to customers in natural condition. No method or process for deepening the color on hackle and saddle ever has been or will be used.

Visitors here are a unit in pronouncing my

flock the richest, darkest colored flock they have seen anywhere. They are as dark as reds can be and remain red. A breeder from the midwest went all over my flocks with me a few days ago and was literally astounded. He stated that he had been informed my birds were too light in color, that his flock was considered dark in the West, and that my birds were darker than his. My Reds also excel in size, bone, head points and type.

1922 YOUNGSTERS

are simply superb. Many firsts have been won by customers in the very keenest competition at the leading Fairs and State Shows. The younger brothers and sisters are now ready for December and January showing. You will find here the bird or birds to win for you anywhere, in any competition. Natural birds that will transmit their superb qualities when you breed them. Grand exhibition cockerels at \$25.00; \$35.00; \$50.00; \$75.00 and \$100.00 each. Superb

show pullets at \$15.00; \$25.00; \$37.50 and \$50.00 each. A few super birds at higher prices. Fine, big, husky utility cockerels surprisingly good in color and type, \$7.50; \$10.00 and \$15.00 each. Perfectly grown utility breeding pullets \$5.00; \$7.50 and \$10.00 each. A few hens and pullets for layers at \$4.00 each. Exhibition cocks and hens a matter for correspondence. Choice breeding hens at same prices as pullets.

SATISFACTION GUARANTEED

every customer of Owen Farms. Do not want you to keep any birds not satisfactory. Rest for 48 hours, return in good order and have your money returned. I pay return charges on all birds purchased at \$10.00 or more each. Have used this guarantee for 24 years and very rarely has a bird been returned. Write me fully

and freely exactly what you wish to accomplish. Will advise you on paper exactly as I would were you here at my desk. Will personally select your bird or birds and give you the advantage of my long experience. New catalogue will be mailed soon. 84 page booklet ready now.

No. 12

Practical Poultry Hints for the Month

COLD weather is here. Are you ready for it?

Don't neglect to feed an abundance of green stuff this month.

Remember regularity in feeding is very essential for winter eggs.

One of the main points now is to get those backward pullets to laying at the earliest possible moment.

Remember December days are short. Therefore keep the birds steamed up by very liberal feeding.

Keep the grit, shell and charcoal boxes filled. Also fill the water fountains twice a day this month.

Keep the layers indoors this month. Wet feet and feathers mean few eggs. The point is to get more eggs when they are high.

Collect the eggs several times a day, according to the weather conditions, to avoid chilling and freezing.

To save labor getting rid of ice, empty the water pails and fountains when you make the last round of the houses at closing time.

Try to be on intimate terms with your poultry this month. Pick them up occasionally. They will lay better if you keep them on sociable terms.

When the night promises to be exceedingly cold, try a late afternoon feeding of good, sound, yellow corn, well warmed.

Where feather eating is practiced try giving the fowls sulphur, a teaspoonful in a soft feed for every five fowls once or twice a week.

Don't be afraid to let in plenty of fresh air during the day. The birds will not suffer from the cold if they are kept busy.

December is none too soon to begin to plan for the mating of the breeding pens and to map out the spring campaign of raising the chicks.

Hens like sprouted oats as much or better than any other green food, and they will do well on it. It aids digestion and increases egg production besides being an easily produced and cheap green food.

Buy your breeding chockerels this month if you have not already done so. If you delay you may save on feed bills but by buying early you get the pick of the early hatched birds.

In ordering your supply of leg bands send direct to the manufacturer and buy in 1000 lots. You can sell out what you don't want by the dozen at a good profit.

If you have not already done so provide drinking fountains which prevent the fowls from wetting their wattles and place the fountain upon a platform so that the water will not be spilled or flirited into the litter on the floor.

If you intend to have new incubators and brooders right now is a good time to make a selection and place your order. Manufacturers will be in a good shape to demonstrate their

Winter colds and frosted combs—
Feed liberally for profit this
month, for December days are
short.**

goods and you will insure early and prompt delivery by getting your order in before the rush season.

If you have not already the needed hoppers for dry mash and for shell, grit and charcoal buy or make them now. Winter care requires growing your fowls as nearly as possible under conditions like those of summer. See

that their food supply is right and fed in no-waste hoppers.

If you want eggs at this season of the year don't stuff the birds full at their morning meal. When the hens fill up the first thing in the morning and then go back to loaf on the roosts, you will get fat fowls but you won't get many eggs. In a short time they will be out of condition, if you don't watch out.

Where dropping boards are used clean up the boards every time there is a thaw, even if you can't clean thoroughly when things are frozen solid. Thawing droppings mean foul, dirty feet for the birds, and fowls with dirty feet soil the eggs in the nests and spoil their market value.

After the pullets have sufficient time to develop naturally to maturity, every day that passes without egg production means a cash loss to the owner. Feed now for eggs and feed liberally. A big portion of the years' possible profit will be made (or lost) during the month of December.

Pullets which are wanted for show birds will need to be carefully handled to prevent them from laying. Change them often from one pen to another. Coop them up for a while. Do not force them with feed. Give mostly grain to eat.

Select all females for the breeding pens before the first of January. You can tell more about the vigor of the stock now than later. Band those that you select and put them by themselves. Select your males now, but do not be in too much of a hurry to mate them with the females. Put a cock with the selected cockerels and he will keep peace among them. Males are much better away from a large number of hens until really mated.

Don't make radical changes in your method of feeding until you are assured that it is poor. Get a good system and stick to it. While it is well to feed a variety, the continued and constant feeding of concentrates is what counts in the long run. It breaks up the hens to be constantly changing feeding methods.

Don't permit broody hens to occupy nests, and you may have them even at this time of year. Remove them promptly the first night they are found on the nest and place them in a breaking-up coop. If you work it right you can break up and have them laying again in a week. With winter eggs at the present high prices you can't afford to have broodies loafing in the nests.

When fowls are troubled with constipation or diarrhea in cold weather do not use (Continued on page 1155)

Warmth, Moisture and Air in Incubation

THERE are three factors that are generally recognized as of first importance in incubation. These factors are temperature, ventilation and moisture. There cannot be growth in the egg, just as there cannot be growth of plants in the ground, without warmth, fresh air and moisture. The regulation of warmth is accurately adjusted in modern incubators by means of thermostatic regulation. The matter of ventilation in the egg chamber has received careful attention. But the third factor, that of moisture in the air that surrounds the eggs, is a subject to which I have given a great deal of thought, and believe that greater importance should be attached to the regulation of humidity or moisture in artificial incubation.

The prime importance of humidity to artificial incubation may be appreciated when it is realized that 100 per cent hatches can only be attained by its use. Heat and the regulation of that heat to a constant temperature of 103° F. is no more important than humidity and its regulation with respect to temperature. Humidity alone will not hatch eggs, neither will temperature alone hatch eggs, but these two elements, together with the third, namely, air movement, will hatch eggs of normal fertility. The term humidity is taken from the Latin word "humidus," meaning moist; hence, instead of saying moisture in the atmosphere, we may say humidity. The term "relative humidity" is used to express the amount of moisture or water in invisible suspension in the air. For example, each cubic foot of air heated to 103 degrees F., when completely saturated, will hold in suspension in the air a maximum of 21½ grains of water. If each cubic foot of air contained but half this amount, or 10¾ grains of water, we would call it 50 per cent relative humidity. The warmer air becomes the more water it will hold in an invisible state. Let us take a cubic foot of air at zero degrees F., which will hold when fully saturated 0.45 grains of water, that is 100 per cent relative humidity at zero. Now let us heat this cubic foot of air to 10° F. and it will hold 0.87 grains of water, almost twice as much water as at zero. If we heat it to 20° F. it will hold 1.32 grains, at 50° F., 4.07 grains, at 70° F., 7.98 grains, and at 105° F., 22.75 grains, or over 40 times more water than at zero ° F.

The Principle of Humidity

To appreciate the importance of water vapor in the air let us consider how humidity affects ourselves.

Humidity is Nature's protective garment, which keeps us warm. Take a nice sunny day in summer and sit out on the front porch with your sleeves rolled up; you will feel perfectly comfortable at 70° F. The thing that makes

By Guy S. Faber

Artificial incubation is the science of utilizing Nature's methods by an understanding of all the principles involved in a proper conditioning of the air.

you feel comfortable is Nature's humidity, which in summer is about 65 per cent, that is to say, there is almost 5 grains of water invisibly suspended in every cubic foot of air around you. Now let's say that we are sitting in our own living room in December with sleeves rolled up; the temperature outside is zero and we have a hot fire in

the furnace with the thermometer in our room showing 70° F. A little wind blowing outside leaks in around the windows and doors and you feel chilly, roll down your sleeves and put on a coat. Yet the temperature in the house is 70° F., the same as you enjoyed out on the front porch last summer, but the humidity is very different indeed.

If you will hang up a hygrometer and read it you will see that the humidity on this winter day with your house 70° warm is about 20 per cent. Your body is losing its natural moisture so fast, being taken up by the greedy air, that you feel like putting more coal on the fire and get the temperature up to about 80° F. Aside from drying up all your furniture so it comes apart, the ruinous effects on your own health are the greatest evils of a low humidity. Let us take a few simple tests to see just how this phenomena of Nature works.

Pour some alcohol or ether on your hand and you feel a chill; place a thermometer in the alcohol or ether and you will find that it is not one degree cooler than the closet in which it stood. The chill you feel is merely the quickness with which it robs your skin of its natural moisture, leaving it very dry and susceptible to any air movement. Stand in front of an electric fan and you imagine it is giving you a cool breeze, but as a matter of fact the temperature is no lower in front of the fan than it is away from it. Try it with a thermometer. The same principle is at work here; the air movement is quickly absorbing your body moisture, leaving it dry to feel the effect of chill only because quick evaporation.

Suppose someone has just taken a real hot bath; you will note upon entering the bathroom that it feels balmy and warm, more comfortable than any other room in the house. The hot water of the bath perhaps raised the humidity to 80 per cent, due to a large volume of steam arising from the hot water drawn to fill the tub.

Sometimes the kitchen feels nice and comfortable and that's perhaps due to mother's boiling tea kettle on the stove, which supplies moisture to the air.

We can also have too much moisture, say 100 per cent. When we begin to cool air we get condensation; that is, the invisible water vapor in the air returning to a watery state. Water passes into the air (Continued on page 1173)

Poultrymen in attendance at the National Poultry Show, held in connection with the National Dairy Show, St. Paul, Minnesota, Oct. 7 to 14, 1922. This poultry exhibition was one of the best ever held in the Northwest.

The Choicest Poultry Meat in the World

IT IS doubtful whether any other class of poultry is given so little serious attention as the capon. Authoritative and helpful information regarding this royal bird is meager, and yet I know of no other that requires such proper publicity as he. For this reason I am led to give a few of my experiences with capons, in the hope that the information will prove of some help to others.

I have been handling capons exclusively and extensively for some time now. Consequently I have given them considerable and special study, and have found out a number of interesting things. I am at present developing a capon farm upon a commercial-sized scale. All indications point to the fact that the capon can be handled in such a manner. But in this care various elements enter which we do not find in other kinds of domestic poultry. And what is more, I am not able to gather much practical information upon the subject to be of any real help to me. The answers I receive are vague, deal with the wonderful profits in capons, and other propaganda of the same character.

The Question of Extra Large Size

I had been under the impression that capons would grow to tremendous size in a short time on little feed. I had thought that I would double their size in a given time, as compared to ordinary male birds. I had labored under the belief that my losses would be practically nothing, that my feed bill would be very little—and many other such statements which my personal experience has shown must be modified. The capon is a source of very satisfactory profits if we handle him and understand him aright. The longer I am in the chicken business, the firmer I am of the belief that the most helpful and really encouraging information is that which tells the truth and lets it go at that. Glowing accounts give us temporary and often false hope which goes glimmering in a short time, leaving the ashes of disappointed hopes. True accounts, on the other hand, prepare us for what we must expect, and we gain rather than lose in enthusiasm and courage as we find out we have good chances to realize our hopes. One man, and he is a shrewd business man, said to me once: "One thing I have found about the chicken business. You can hardly believe anything you hear." A fine sort of indictment, isn't that? And yet pretty true of many of us. Poultry writers must bear their burden of this blame, so I am going to tell the plain, unvarnished truth. I might just as well in the beginning, for sooner or later what I write will be found either to be one thing or the other.

By H. G. Forster

How to grow the finest table poultry—Capon are the beef producing steers of poultrydom—How to feed and handle them.

The operation of caponizing does more than merely remove the reproductive organs of the fowl. It takes away a certain life force, or energy—call it what you will—that permanently lowers the fowl's vitality and therefore ability to withstand the vicissitudes of life. It is not necessarily se-

riously weakened, but I doubt whether capons—and especially those kept in larger units—ever can stand the abuse and lack of proper care that other fowls can, and "get away with it."

This is logical to expect. The vital life forces connected with the reproductive organs give males a strength, and sturdiness, and an energy which the emasculated chicken cannot hope to possess.

Basing our whole care on this assumption—and few disinterested and experienced poultrymen will disagree with me—we find that capons need a little extra nursing, a bit more attention to details.

Personally I believe it better to grow capons in fairly small units, say not more than one hundred to the flock. They can be raised successfully in larger ones, but it requires special attention and knowledge. In any case, all capons require uncontaminated ground. The greener, the more permanent, abundant and extensive the range, the better. In the earlier stages of their "caponhood," they range quite freely, growing less enterprising as time goes on. If plenty of shady range be available, no particular limit need be placed on their numbers running together, within reason. I run from 750 to 1000 together for several months with a low mortality percentage.

The following summer feeding schedule may prove of interest and help. I use it with uniform success:

1. A light morning scratch out of doors whenever possible. This may consist of the standard grains in standard combinations.

2. A noon feeding of some good moist mash, all they will clean up in about thirty minutes. Plenty of headroom for all. No crowding allowed, and all getting all they want.

3. A plentiful grain feeding at night—all they will take.

4. Dry mash and plenty of clear, cool water before them at all times.

5. If fowls seem a little off par, a recognized tonic or regulator may be placed in the dry mash in reasonable quantities. I am not generally an advocate of any sort of aids of this kind, but occasionally they are effective,—if not used too frequently and in too great doses.

6. If shade and natural green forage be further supplied, the capon has a pretty good sort of home.

(Continued on page 1158)

Capons on the New Jersey farm of Harry G. Forster, author of the accompanying article. If anyone thinks that New Jersey is an exclusive white-egg producing state, they should travel through the capon growing sections of Mercer and Burlington Counties. Mr. Forster is engaged in the production of fine table poultry. The illustration shows a scene on his farm when, at noon every other day, a moist mash is fed. The capons receive all they will clean up in 15 to 30 minutes.

The Illinois Egg Laying Competition

SOME years ago Theo. Hewes visited a White Wyandotte breeder in the State of Illinois and in writing up an account of that visit said: "Mr. Peters met me in Galesburg and drove me to his farm in as fine a new buggy as any man would want. He had purchased it with the proceeds of the sale of 4 White Wyandotte pullets."

As I returned home from a visit to the contest grounds of the Illinois Egg Contest at Quincy, I had occasion to stay over night at Galesburg, and sitting in my room in the hotel, the remarks of Theo. Hewes ran through my mind. Four pullets that paid for a buggy! What made those pullets worth fifteen to twenty dollars apiece? This question can be only answered by saying: The fact that they were purebred and could be counted upon to produce uniform offspring. Those pullets represented good breeding in their day. The Western country was just coming into itself and buyers were seeking improved breeds of poultry to take the place of mongrels.

Today improved live stock means more than pure breeding. In dairy cattle it must include the hereditary capacity for high production. In beef cattle and pork hogs it must include the hereditary capacity for the economical conversion of grain into meat. Different kinds of tests are provided. Pedigree papers and registration are not alone the basis of value. Live stock breeders already refer to culling out the "scrub purebred."

In the poultry world likewise, proving grounds are being established. Many states have their egg competitions. At the last session of the Illinois Legislature, \$32,000 was appropriated to maintain and conduct two egg competitions in the Prairie State, one at Quincy, the other at Murphysboro, Illinois.

The Governor of Illinois placed in charge of these con-

By Frank L. Platt

Egg contests as important as poultry shows—Are the tests fair—Some of the records made at the Illinois contest—Housing and trapnesting.

tests, one of the most prominent poultry breeders in the state, C. P. Scott of Peoria, Illinois. Mr. Scott is prominent as a breeder of Single Comb Rhode Island Reds and last year was President of the Rhode Island Red Club of America.

A Talk With Scott

I had stopped in Galesburg, on my return from Quincy, for the purpose of taking the train the next morning for Peoria. Upon arrival in Peoria, Scott met me at the station. Driving out to his home in a new automobile that chickens had paid for, he said:

"This car represents an order for 14 Reds, which I recently received for export. The draft was for two hundred and fifty pounds sterling (\$1,200). The birds that I shipped to Cass in England gave me a sort of international reputation. This last order goes to South Africa.

"As you know, poultry is not my main business. For the past five or six years my average year's business in breeding stock and eggs for hatching has run \$6,000 to \$7,000 a year gross. I do not handle the business end of my poultry business as economically as perhaps, I should. It makes for me about \$1,500 to \$2,000 a year net. If I could do all the work myself, it would make a good business for a man. But, being engaged otherwise, I have to hire a poultryman and run my Reds as a side line.

"I am glad you liked our layout at Quincy. These egg competitions are a great source of educational help. Fanciers should and will take more interest in them. If I were going into poultry as an exclusive business I would take these contests seriously, and enter my birds in them. I have always believed in poultry shows, and have time and again shown my birds in competition. Poultry exhibitions are the life and inspiration of the purebred business. I don't mean to discount them. But, our egg competitions are going to develop a new phase of the breeding business by laying emphasis on the fact that a chicken must be of some honest-to-goodness value to the buyer. The chicken should not be a hundred dollar chicken because somebody says he is worth \$100, but because he will do somebody some good. We want to preserve the things that all fancier-breeders call good, because they make the purebred chicken, and then we must stamp into our strain those hereditary factors that will transmit efficiency in the nest.

"I have just sent ten pullets to the Storrs, Connecticut contest. They were a nice bunch, not colored like a patch-quilt. I sent them yester-

Interior view of one of the 16x16 ft. pens of the Quincy contest houses. Upper right hand corner, exterior view of house. There are two sets of windows in each pen. Upper left hand, a battery of five trap nests. Record cards are tacked on top the nest with a hinged board that comes down to cover the cards and keep dust and dirt off of them. Lower right hand, an 8x12 colony house for brooder stove. A number of chicks will be grown in 1924, as it is planned to retain some of the record birds in the contest which runs from Nov. 1, 1922 to Oct. 31, 1923, and breed them, so as to study breeding values as well as housing and feeding for high egg production.

day, and wish they were here for you to see. All but one of them were pullets that would sell at \$25 to \$30 each. Multiply that by nine, and it is plain that it cost me something to send that pen to Storrs. But, I believe in it. In 1921 I had a pen at Storrs, and four of the ten went over 200 eggs each, their individual records being 216, 208, 202, 209. That is better than I did in our own Illinois contest at Quincy, where my best pullet went 193 eggs for the year just closed."

Are the Contests Fair?

The question of fairness of the egg competition is paramount in the minds of many breeders. They can see the birds as they stand in a showroom and their quality is so self-evident that any discrepancy on the part of the judge is at once discovered. But the show is of short duration and the birds are not so dependent upon the care and feed of the attendants as in an egg test which is a try-out for a year, during which time the caretaker may develop a tendency of favoritism toward certain birds and certain pens. Every breeder knows the stimulating effects of kindly care over a long period. Again, the attendant is expected to get eggs and the birds under his management are expected to make records, and here, it is sometimes felt, a moral hazard enters into the work. This human element, which has been called hazardous, may be summed up by saying: The caretaker works for a living; if he can't get 'records' somebody will be put on the job who can.

The first one of these points, that of favoritism, is overcome at the Illinois Egg Contest at Quincy by putting five different pens of five birds each, entered by five different owners, in each 16x16 ft. division of the house. That makes twenty-five birds which receive the same care and attention, in each lot. Even the floor eggs, i.e., those laid outside the trapnets, must be proportioned, in the final records, among the five pens of birds and not credited to any one individual hen in a single entry. This makes for fairness of opportunity among the contestants.

The second point, that of moral risk due to the ambition of the employe in charge to make good on his job by making attractively high records, can only be overcome by picking conscientious, earnest workers. No drifter can get a job at the Quincy contest. The men who do the work are men who carry the sign-boards of honesty in their faces. Then there is the attitude of the directors who employ the men who feed the hens and gather the eggs. The manage-

ment of the contest is not passionately seeking that publicity that would accrue to world-beating records. If they should ever get a phenomenal record layer, well and good, but the discovery of one or more such birds is not an obsession. The management makes no apology for the high record of 247 eggs attained by a single White Leghorn female in the contest that closed Oct. 31, 1922. Indeed, it is felt that that record is very good.

There is another subject that should be mentioned in connection with the word 'fairness.' For a long time many breeders of the heavier breeds of poultry, the dual purpose types, have felt that egg competitions were eminently unfair because these contests take no account of the meat value of a chicken and put the whole premium on eggs. On this important matter, Mrs. E. W. Mahood, President of the Rhode Isl- and Red Club of America, recently wrote me as follows:

"A number of things have started me thinking along the egg laying proposition again and what all this ado about high record birds, with their bona fide and otherwise records, are doing to the business of the fanciers of heavy breeds. One thing it seems to be doing is to turn some of us into enemies of the truth. At least a few of us do not seem to be on as friendly terms with this shining angel as we might be.

"I have an idea in my head on the matter, and it may be just as well if I kept it there, but I am going to take it out for your inspection anyway. It does not seem to me fair that the heavy breeds and the egg type breeds should compete against each other in the egg laying contests. The dual purpose breeds undoubtedly have a big handicap in these tests of thin horses on fast tracks.

"Could a movement be worked up to make one class for heavy breeds and one for egg-type breeds at these contests? At first glance this might seem like admitting that the heavy breeds cannot compete with the others as layers. Well, they should not be expected to, and if we admit this frankly, by separating the classes, would it not soon be generally understood that a combination egg and meat breed has virtues not possessed by the egg type or light breeds and are for a different purpose.

"If this were done it would be necessary not to admit birds under a certain specified weight in the contests. This would help to impress the idea that eggs are not the only value of a chicken. I have particularly noticed two famous egg laying strains of Barred Rocks and they run very small. Why keep Barred Rocks if they are no bigger than Leghorns?"

What do you think of that letter? One thing, Mrs. Mahood is awake to current conditions. The breeders of general purpose fowls have set still too long. They have set back with the silence and dignity of the old, historical Roman Senate while the invaders

Practical Advice on Feeding the Flock

By **T. S. Townsley**

The whole science of feeding reduced to practical, common-sense terms—Under-feeding is common—How to make a good feed.

CONSIDERED from the standpoint of national economy, the principal reason for keeping poultry is to provide a means of transforming vegetable, animal, and mineral products into eggs and meat which are more edible or more palatable than the original product. Stated plainly, the chief reason for keeping chickens, aside from sentimental considerations, is the purely business-like purpose of furnishing a way for transforming corn, wheat, oats, and other materials eaten by chickens into meat and eggs.

The poultry keeper who considers each hen as an individual machine and remembers that before a machine can turn out finished products raw materials must be provided, he will probably not go far wrong in his feeding methods providing he studies the needs of his machine. The study of a hen as a machine capable of producing one of the most highly specialized manufactured products known to man, is one of never ending interest to the student and presents a great many baffling details which scientists have scarcely begun to unravel.

The average man or woman who keeps hens for egg production may understand comparatively little about the intricate processes which take place in transforming common poultry feeds into the completed egg with its ready-made container, the shell; its palatable fat, the yolk; its nourishing protein, the white; and its potential ability to produce the chick contained in the germ; but even the newest amateur poultry keeper ought to know something about the food elements needed to keep the egg machine in good running order and to furnish the raw material for making a satisfactory output of the finished product.

While there is doubtless room for much further investigation by scientific workers on many of the problems connected with egg production, sufficient experimental work has been carried on to establish a number of rather definite fundamental principles which every poultry keeper ought to know and apply in his feeding methods.

It is rather definitely agreed among poultry keepers in general that fowls must be fed sufficient quantities of food to keep them in good flesh that they must be fed a ration containing the essential elements for egg production if they are to lay successfully, that they must have unlimited quantities of water to drink, and that certain protective foods must be included if the birds are to remain in good health.

Hens Too Fat to Lay

One of the greatest handicaps to the poultry industry as a whole, has been the notion that hens could successfully scratch for the major part of their living and that there was grave danger of getting them too fat to lay profitably if they were fed according to their appetites. Poultry extension men who handle thousands of birds annually throughout the states in which they work report that at least three-fourths of the fowls handled and probably 90 per cent of all the fowls in any given state are underfed. This results in the young stuff being more or less stunted in growth, weakening the general vitality of the flock, and lowering the egg producing capacities due to late maturity and poor development.

With the laying flock, underfeeding results in a low egg yield and a high degree of susceptibility to disease due to the weakened condition of the birds.

In one of the largest poultry producing counties in the central west, which in justice to the poultry keepers in that country who are feeding correctly, but who are in the minority, will not be named in this article, a very serious poultry disease problem has developed within the last few years. A man trained in poultry disease investigations was called into the county to make a survey of the situation. After going over the ground rather carefully this man announced that improper feeding methods, and particularly the lack of sufficient feed, was the pre-disposing cause for the disease outbreak, and advised the poultry keepers in general that if they would pay more attention to feeding methods their troubles about diseases

would be very greatly lessened. In this particular county the size of the farm flock has increased very rapidly during the last few years, with the result that on farms where forty or fifty hens previously were able to pick up most of their living in the form of waste grains, table scraps, surplus milk, and what bugs and worms could be picked up in

ranging over the farm, the four or five hundred fowls that are not being fed quantities of feed proportionate to the size of the flock.

A little simple observation on the part of the poultry keeper will convince him that a hen must be fat before she can lay and will also convince him that far more hens that are in poor health are under weight than will be found in the class that are too fat. Of course it should always be borne in mind that the amount of feed is only one factor determining the health and productiveness of the flock, and another point of practically equal importance is the kind of feeds fed.

The experiment station has shown that about four-fifths of the feed which the average hen eats is used for body maintenance in producing energy and repairing broken down tissue. Unless the hen has a sufficient quantity of feed to keep herself in good physical condition there will be no egg production.

Fats and Proteins

There are three chief classes of food elements which enter into the egg, and if the hen is to function as an egg machine some attention must be paid to supplying these different kinds of food stuff. The yolk of the egg is largely fat, while the white of the egg is principally protein, and the shell is mostly lime. Fat, protein, and mineral elements, including lime, are also the materials needed for the part of the ration that goes to keep the hen alive. She derives most of her energy from carbohydrates or fat-forming foods, while she needs protein and mineral elements to build muscles, bones, and feathers.

The feeding problem, briefly stated, so far as the question of furnishing material for maintaining the body and making egg production, resolves itself largely into the matter of supplying fat-forming foods, protein containing elements, and mineral materials.

The fat and energy needs of the fowls can be readily supplied through the common farm grains. Of these, corn is probably the richest in food materials and is one of the most palatable to the hen. In all sections where corn is a staple crop the hens ought to receive enough corn to enable them to keep in a good thrifty condition and to have enough surplus fat for manufacturing egg yolk.

The other common farm grains are also valuable as sources of fat in the poultry ration. Wheat, kafir, oats, and barley are very commonly included in the poultry ration and are satisfactory feeds.

Rye is not particularly well suited for poultry feeding because the birds do not relish it, but most any of the other farm grains can be safely fed to poultry, and sufficient quantities of whatever grains are available ought to be fed to every flock to keep them in good flesh.

Many poultry keepers have found from experience that feeding grain alone will not make the hens lay no matter how fat the birds may get. Indeed, the one danger of fowls getting too fat is under conditions where they are fed plenty of grain, but do not receive the other elements needed for egg manufacture.

Since the white of the egg represents approximately two-thirds of the total bulk, there would appear to be a need for considerable protein in the ration if hens are to lay satisfactorily.

Animal Protein Supplement

While most of the grains contain some protein, it has been found in feeding tests that hens will not lay satisfactorily unless protein from some animal source is included in the ration. The protein in egg white is (Continued on page 1152)

Historical Account of the Black Langshan

IT WAS not long after an ancient

Chinese black breed of poultry was imported into England by Major Croad that an enthusiastic admirer referred to it as the "Lordly Langshan," an appellation which has stuck to the Black Langshan ever since. The majestic and towering appearance of the Langshan cock no doubt inspired the early writer to give the breed a name its striking shape characteristics and resplendent black plumage deserved. It was the black diamond among the domesticated feathered races at that time, and has lost none of its illustrious characteristics up to the present day.

Like all other good breeds, the Black Langshan has had its ups and downs in the race for popularity, but like the real thoroughbred it has proved to be, it more than held its own, and just at present is staging a remarkable "come-back," both in England and in this country.

The distinctive breed type and true reproductive qualities in standard shape and color with its superior meat and laying qualities appeal to both the fancier and utility poultry keeper. The Black Langshan has proved to be all this, and has also proved what far-sighted poultry fanciers believe and demand, namely, "Handsome is as handsome does." Beauty may be a very fine thing to look at and admire, but feed bills cannot be paid with fine feathers alone.

The history of the Black Langshan from the day it arrived in England fifty years ago would fill a good-sized book if carried through to the present day. Much of the printed matter in English poultry journals relating to Black Langshans in past years, applied to two distinct types of Langshans bred in England—the Croad and Modern. The Croad is the original type, one which Miss A. C. Croad valiantly defended against the marplot fanciers who evolved that impossible freak—the Modern Langshan. The evolution of the Croad into the Modern Langshan is well sketched by Mr. Ludlow, the artist, in the illustration presented below. It is an object lesson to Langshan breeders of America in demonstrating what English faddists have done to destroy the original type of this ancient Chinese breed. The Modern Langshan, happily, has not emigrated to this country, the Croad Langshan is still on top in England and always has been recognized as the true Langshan by American fanciers.

Origin of Black Langshans

The true origin of any breed of poultry is usually a subject for continuous discussion by

By J. H. Drevenstedt

The original Langshan—Changes in type—The points that make for quality in the modern bird—Mating.

interested parties. Much of the data given by writers is often more imaginary than real. The fact is, even the originators of new breeds and varieties are not always sure just how "they did it," or where they secured their foundation stock.

Our Standard breeds and varieties of poultry are the result of cross breeding in most instances.

Much printer's ink and many tons of paper were used in discussing the Langshan years ago, but we arrived at the conclusion that the only reliable source was the home of the Croad Langshan. This led us to write to Miss A. C.

Croad for authentic information on the subject in 1894, and received a letter in reply giving what we believe to be the most authoritative data on the origin of the Langshan fowl. Miss A. C. Croad in a letter written at Poling House, Poling, Arundel, England, December 8, 1894, conveys the following facts:

"Since commencing this letter. I have read an article on 'The Origin of the Langshan' that has appeared in a contemporary. The writer tells us he does not believe the Langshan to have been of Chinese origin. He says they originated in England and some of them perhaps in America. He speaks of the breed as a mixture, and says many Langshans show yellow feet. He adds, 'I have seen this yellow in the progeny of imported birds—birds supposed to have come from Miss Croad's yards.' He continues: 'She is still working on the original graft. Neither is she so foolish as to tell just how the Langshans were made.' He says: 'Thousands of Langshans have been made in England and shipped abroad.' Of this latter fact there can be no doubt, and it is evidently these mongrels and not the true Langshan that this gentleman has become acquainted with, and even of these he writes, 'There is no better fowl.' What would he say of the pure bird, I wonder?"

"It was on the 14th of February, 1872, my uncle, the late Major Croad, received the first Langshans that were ever exhibited in England. I believe a cross with the Langshan and also a few (Continued on page 1147)

The nicely modeled Langshan hen of the American breeder. Here are seen to advantage the bright, alert head, the round contour of breast and back, the rather long and well-spread tail, a body of good depth evenly balanced on firm, straight legs, a large abdomen for egg production, and the smooth plumage which in life carries a greenish sheen and glossy lustre. Shanks should be feathered down outer sides only; middle toes bare. Standard weight for hen, 7½ lbs.; pullet 6½ lbs.

What happened in England when English fanciers distorted the original Croad Langshan into a caricature. American breeders have never departed from the original type, believing that the greatest beauty and usefulness existed only in the true type of the ancient Chinese Langshan. Today the stilted "modern" Langshan is on the decline in England, with the Croad type in the ascendancy. German breeders changed the Langshan in their country only to the extent of breeding the feathers off the shanks, making the German Langshan clear legged.

The Modern Breeder

Poultry culture is entering the third lap of its course. First was the game fowl whose ferocious character won for it the admiration of a barbarian people. With the progress of civilization there developed the artistic taste of the fancier. And now we witness the passage into that new state where the economic qualities of poultry command a new value.

First was the pit game breeder. We owe much to him, and to his birds. The high valor and defiant deeds of those monarchs of the battle, are what originally lead to the world wide distribution of the feathered race. The sport of cock fighting was chiefly instrumental in introducing chickens in the first place, into Persia, then Ancient Greece, on into Rome, across the Alps to the lands of the Gauls and Britons. Constructive breeding first came into play in perpetuating strains of pit games that were stout and sure. The old cockers bred a bright and beautiful bird, bold with enduring courage, vigorous, healthy, strong.

Then came the early fancier. The savageness and cruelty of the pit repelled him. He met with his friends at the tavern and there compared birds. Perhaps the inn-keeper would offer a pewter mug or a copper kettle for the best. Slowly, gradually, beautiful feather patterns developed out of the confused mass of breeding material. Such charming and wonderful races as the Penciled Hamburgs, Spangled Hamburgs, White Crested Black Polish, White Faced Black Spanish, Sebright Bantams, and full feathered Cochins came into the glory of full bloom.

We owe much to the methodical fancier of yester-year. The beauty standards that he fixed to appeal to the eye and gratify the senses, command admiration in what are today known as the ornamental breeds. The thought and care that he bestowed upon his birds rivaled the keenness of interest displayed by his predecessor, the old cocker. Money might buy his finished products but only a genius possessed by the few could produce the birds whose many niceties fulfilled the dictates of the eye. The fancier was a breeder-artist, greater than the artist who paints a picture upon canvass, or the sculptor-artist who makes a model in cold, dumb stone. The breeder-artist put into a living thing the bright and beautiful colors of the painter, and working with the invisible and none too well understood laws of heredity, shaped the plastic material with which he worked into his ideal.

Today a new kind of breeder makes his bow and bids for the patronage of all those millions who keep chickens for what they are worth. He has essayed for himself the job of taking the breeds and varieties and, after preserving the health and vigor which were the aims of the old cocker, after preserving the beauty and symmetry which were the aims of the early fancier, adding to these things his own contribution of usefulness. That is the job, the opportunity, of the modern poultry breeder. Call him fancier if you will, he is more than that—he is a constructive improver of one of the most valuable forms of live stock in the whole system of animal husbandry.

If an egg breed, his job is to produce good type and color, in combination with an inheritance for high egg yield, that he may sell Standardbred cockerels that will gear up the egg production of the pullets he sires, although they will eat no more feed to produce the extra eggs. He breeds a 3½-lb. female that will open the fountain springs of her nature and produce as much as 35 lbs. of eggs in a year, ten times her own body weight in eggs.

In short, he has learned how to breed and produce those

qualities which are at once practical and efficient, in combination with vigor and beauty, and his work is commanding a new attention and a new value. He is proving the worth of his birds in the show room and in the egg competition. We must recognize both these agencies.

To deny a place to egg laying contests is to attempt to shut the door to progress. It cannot be done, any more than in those earlier years could the jests and criticisms of the old cockers, who tested their birds in the mortal combat of the ring, turn aside the fancier or stop the growth of the poultry exhibition where the birds were shown in coops.

The present era of the modern breeder does not mean the destruction of the past. Both the cocker and the early fancier contributed something of enduring value. First, the breeder of cocks for the pit produced a fowl of alertness, graceful poise and stately walk. He was the first breeder of poultry. From generation to generation, from century to century, the boldest and most symmetrical birds and those of the purest breed, were kept, while the weak, ill-formed or poor-conditioned specimens were set aside. Some of the defects that the cocker considered serious were crooked breast, flat sides, imperfect eye, duck or short feet, unhealthfulness.

The cocker was a specialist. He carried his hobby so far that even the hens of his breeding were cruel and pugnacious to one another. Then came the dawn of the fancy. The early fancier took up the work where the cocker left off. He also scrutinized every bird before it went into his breeding pen, and a specimen that was foul grown or disproportioned was rejected as unfit to breed from. Building on this foundation of health and type, which was first laid by the cocker, the fancier in the pursuit of his higher art, began to unfold new beauties. Markings on the individual feathers began to appear, and contrasting designs of color were bred to a perfection rivaling anything found in nature.

Then came the modern breeder. He took the available material and fashioned our modern Plymouth Rocks, Orpingtons, Reds, Wyandottes, Leghorns, Brahmas, Cornish and Sussex. The foundation is there, and from year to year, with advancing knowledge and experience, new beauty and new worth are added.

First, the warrior; second, the artist; third, the workman, who is applying the skill of both past and present to the needs of today. He is the modern breeder.

The Ideas of Felch

I. K. Felch, Massachusetts, a pioneer in standard poultry culture, died in 1918, after a useful life of eighty-four years. Felch was a fancier from boyhood days. He has related how as a boy he once went without his dinner and walked miles to secure a coveted pigeon. Felch grew up with the purebred poultry industry of America, beginning at a time when practically no one around him mated to preserve racial types. He helped to make successive editions of the Standard, being one of the main pillars of the American Poultry Association for many years. Felch did much. Every scale of points by which birds are today judged, was, in its original, the product of his design.

The breeder of today may not know much of Felch, but "Uncle Isaac, the Sage of Natick," as he was once known, exerted an influence on the shows, the judging, the press, the Standard, that gave direction to the course which the purebred breeder of today is pursuing. It is because of the influence he exerted in shaping the Standardbred industry that his attitude on important matters is of moment today. The really important thing in each period and each

generation is the frame of mind. What the leaders believe, what they are thinking about, we must seek for, and must understand, for it is the thoughts of these minds that indicate the future trend of affairs.

Two matters of importance, on which all breeders of today are seeking enlightenment, were thought out and discussed by Felch with the force of prophecy.

On the question of utility in combination with Standard quality, he wrote:

"Many of us are rearing fowls for the love we have for the beautiful found in animated nature, but take from this industry its utility, and the numbers raised would be but as a handful of sand compared to that which makes up the ocean's shore. This influence you see in the ornamental breeds, in the scarcity of numbers in our exhibits of them.

"Those breeds having the greatest practical worth, being the greatest layers, those producing the largest eggs and the best meat as broilers and roasters, those laying the largest number of eggs in the winter months, these will ever be the kind to hold the popular call and the steadiest sale, and their breeders will always be 'tided' over a dull season; while the breeder feels more quickly the fluctuation of the market whose tastes lead him to breed those termed ornamental.

"We have only to survey the field to find that a majority of the breeders, who make poultry culture a business and means of support, are breeding the most practical kinds."

In his advocacy of practical qualities, Felch combined the need of practical systems of mating. In *American Poultry World*, November, 1914, he said:

"Why do breeders hesitate longer to demand that perfection in Standard descriptions shall be such that 50% of both sexes that are reproduced from a single mating shall score 90 points or better in both sexes? No other mating can be termed thoroughbred. Why create a false taste that is destructive to nature's plan and detrimental to the profit earning power of the breeds? When we work hand in hand with nature, no breed needs a handicap in its favor."

Younger breeders have been thinking along this line. When Speckled Sussex were admitted to the 1915 Standard, A. O. Schilling stated:

"The first and most important object in creating a Standard description for a breed is to establish a definite pattern and shade of color in the male that is in harmony with the color and markings of the female."

That was done, not alone in Speckled Sussex but also in Silver Campines, according to the best knowledge of those who prepared those Standard descriptions, and after eight years of such a Standard the question may be fairly asked: What breeds have shown greater improvement in quality than these? At the last New York show, no parti-colored bird in the great arena approached perfection closer than the 1st Silver Campine cockerel. In Speckled Sussex there are three colors, red, black and white, yet this tri-colored pattern has been wonderfully and beautifully developed by breeders because the Standard was framed along lines that made the exhibition male and exhibition female consistent mates for one another from a breeding standpoint.

Some old fanciers may say: "Do not make our variety too easy to breed, or the fascination that is wrapped up with the difficulties will never be discovered."

Quite right. The fascination will not be discovered because no one will hunt for it. Take the Cochin, pretty in a picture, rich in the dreams of past associations and friendships, but who is going to breed it when the present crew vanishes? Who, among the new men, is going to set 50 eggs to get 7 chicks? Few indeed will ever find the fascination of the full-feathered Cochin because of the difficulties.

There are certain limits to man's ability to make ideal Standards. In the case of the Barred Rock, we are face to face with a sex-linked character. The breed inherits barring from the male and color from the female. Therefore, the male is to be more barred than the female. That makes him lighter in color. A dark female is needed to feed that color.

In Brown Leghorns, the difficulty has been overcome. In the old Standard, the male and female did not represent a true variety. The exhibition male and female could not be mated together. That order is changed, and the new Standard will list Light Brown Leghorns and Dark Brown Leghorns, each variety consistent within itself. This change is not without some dislocations. There can never be any gain without some loss. But it serves as a powerful example that the day is passed for artificial Standards.

The 1923 Standard will score a great advance in the Partridge varieties. The finest penciled hens always have penciled necks. The best hens to produce solid black striping in males are those that have striped necks. Such a situation demanded a compromise. The result is that the 1923 Standard will call for a neck in the female that is striped, with some penciling, and a saddle in the male that is striped, while a red quill in the center of the stripe is permissible. Such birds can be bred together, and can be shown together. Furthermore, in getting away from double mating, and the dark cockerel breeding pen, we should see fewer cocks and cockerels with black shawls around their necks.

None of the large breeds feathers better or produces a richer golden carcass than the Partridge Wyandotte or the Partridge Rock. Why should they be difficult to breed? It is just as natural for them to be penciled as it is for a white hen to be self-colored. And with a Standard that simplifies and makes practical the problem of mating, the popularity of these varieties should increase five-fold.

In Silver Laced Wyandottes the dark slate undercolor that some judges desired has made it necessary to keep for breeding some females that were so dark in color that the excess of black showed all over them. The 1923 Standard will call for a Silver Laced Wyandotte male that has light slate undercolor at base of hackle and saddle. That will simplify the work of breeding exhibition males from an open-laced exhibition female.

Such are some of the practical and sensible changes made in the text of the new Standard. Couple this trend of the times with the new course of handling birds in the show rooms for back shape and size of abdomen or body, and it at once is plain that the purebred chicken business is emerging into a new era when the usefulness advocated by Felch, and the harmony of male and female Standards advocated by Felch, are to be accomplished facts.

At last, four years after his demise, the two greatest ideas of Felch have triumphed. The old order is gone. To Felch belongs the credit for the reformation.

These two big ideas of Felch are going to go on. There is no stopping point in sight. The young breeder should read again the two quotations from Felch, the first one on utility properties, the second one on standardization, and make them a part of his own daily work as a breeder of purebred fowl. He should say to himself: My breed must be fashioned along economic and practical lines; and, extreme matings to produce an aesthetic standard are no longer to be encouraged. That was the fundamental attitude of the 1923 Standard makers. It should be the underlying frame of mind of the breeder.

Frank DeLancey—Adventurer

Frank W. De Lancey, candidate for President of the American Poultry Association, has a plank in his platform which states that he is in favor of the closest co-operation with the specialty breed clubs, and that when a specialty club decides any matter relating to the Standard of the breed it champions, the decision of the club shall not be altered in any way, but shall be accepted as final by the American Poultry Association.

In other words, if a specialty club of Partridge breeders decides to call for a "cherry red" color in the male, the A. P. A. shall in no wise alter that description, although old Standard makers know that there are a dozen different shades of red color in cherries, and therefore the term "cherry red" is about as indefinite as a color term could be.

The American Poultry Association has a higher authority than any coterie of specialty breeders. It is an organization that is vested with the power to command jurisdiction over the Standards of the breeds. Why have an A. P. A. if the notions of the specialty clubs are to be final and unalterable? Why not simply have a federation of specialty clubs?

De Lancey in writing a plank into his platform calling

REGAL SENSATION 2nd CHAMPION WINNER
BRED AND OWNED BY
J. S. MARTIN PORT DOVER ONT. CAN.

REGALS

IN THE

ARGENTINE

WIN

GRAND

CHAMPION

PRIZE

In the first Laying Contest held in the great Argentine Republic to the South, Regal-Dorcas White Wyandottes in the hands of Mr. A. Diez Mori win the Champion Gold Medal and \$300.00, in competition with a long list of pens including all the popular varieties. The following letter from Mr. Mori is explanatory:

Ituzaingo, Oct. 8th, 1922.

John S. Martin, Port Dover, Ont., Can.

Dear Sir:

Some years ago through a person in New York I was able to get a pen of your famous White Wyandottes. Notwithstanding the change of climate they turned out to be exceptional layers. From fifteen pullets which I trapped I had two that made records of 263 and 251. These two wonderful hens I mated to a fine well chosen cock of the same family and produced five pullets which have just won the Champion prize in the first Laying Contest held in the Argentine.

Taking note of the fact that the glory is due you who have established the outstanding and permanent features of the Dorcas line, I wish to thank you for such excellent fowls. I now wish to purchase more birds. Please send prices and particulars on males and females.

I am

Yours truly,

A. DIEZ MORI.

The Regals are world famous. In one week recently, shipments were made to 21 foreign countries.

The reason of this wonderful popularity is simply due to the fact that no strain of domestic poultry combines beauty and usefulness to such a high degree. Regal-Dorcas type is adapted to greatest egg production and they are of the ideal size for quick maturity.

John S. Martin, Box 51, Port Dover, Ont., Can.

for the final authority on Standards to be vested in the specialty clubs, appeals to all sorts and descriptions of selfish breeder interests that would like to have standards made to fit their birds. He would turn over the A. P. A. Standard of Perfection to the clubs and be done with it.

It is well enough that the A. P. A. should receive suggestions from breeders and clubs, but it should not be bound to accept every word of the changes that are proposed or the additions that are proposed to the Standard text. The A. P. A., composed of the representative breeders of the country, should preserve its judicial powers unimpaired that it may continue in the future as in the past to sit as a jury to accept or reject every motion that would alter a single line in the Standard of Perfection.

At the present time all changes suggested in the Standard first come before the Standard Revision Committee. Sitting upon that committee have always been men who are familiar with the history of Standard making, who have a wide general knowledge of breeds and breeding, and who have the technical ability to edit and produce a Standard of Perfection.

To dispense with the Revision Committee, to displace and supersede the American Poultry Association as a Standard making body, and bring into existence a lot of inharmonious, incongruous specialty club standards is the most radical measure ever advocated by a prospective President of the A. P. A.

De Lancey's plank is so broad that indeed, there is neither limit nor qualification to the scope of his words. The plank reads:

"10. I am in favor of the closest co-operation with the specialty clubs and a majority vote by them on all matters relating to their breed **SHALL BE CONSIDERED FINAL** by the American Poultry Association."

The poor old A. P. A. is to have no voice in the matter. If the Barred Rock Club votes 302 in favor of two varieties and 77 not in favor of two varieties, that vote "shall be considered final by the American Poultry Association," notwithstanding that 464 new breeders had just been elected to membership in the club and the vote largely represented the viewpoint of those new breeders.

If the Rose Comb White Leghorn Club votes 37 to 18 in favor of increasing the weights of the hen and pullet one-half pound, that vote "shall be considered as final" and binding on the A. P. A., notwithstanding that the breeders of all other varieties of Leghorns object to an increase.

It is the A. P. A. that now keeps the Rose Comb White Leghorn men in line with the Leghorn breed. It is the authority of the A. P. A. that preserves the integrity of the Standard in all its essential parts.

De Lancey, without reservation, would give to the Rose Comb White Leghorn Club its own Standard. He would hand to the breeders of one variety any advantage they might seek over the breeders of any other va-

DON'T TAKE CHANCES!

**Ship Your Hatching Eggs
In The SAFEST Container**

PLYMOUTH PACKAGES—used exclusively by many successful breeders—are the type recommended by poultry schools, journals and breeders. They meet all Parcel Post requirements. Not a makeshift nor an experiment, but a distinctive, colored basket made especially for poultrymen. Supplied in four sizes—1 setting, 2 settings, 50 eggs, 100 eggs. Produced in a factory that has made good baskets and packages for three generations. Can be used for all sizes and kinds of eggs. Write for "The Best Way to Ship Settings of Eggs," and ask us why we call this "The 10,000 Mile Package."

riety, for the dictates of the breeders of each kind would be final.

We are opposed to plank No. 10 of De Lancey's platform. We so stated in the November issue of the Journal, but the point seems to have been generally overlooked. We have so stated to Mr. De Lancey in a letter. His reply is that when a candidate can write fourteen planks in which we find several to commend, and are in uncompromising disagreement with only one, it is a pretty good showing.

On the basis of percentage he is right. But in practice he is as wrong as Calhoun, who would have split the national government into sovereign states. A great war was fought on that issue of state rights, to preserve the Union. Again, he is as wrong as the man who said that he was a loyal and law-abiding citizen because he agreed with everything in the Constitution of the United States except those sections which granted to the Supreme Court the power to establish the meaning of all laws, and the power to declare unconstitutional and prevent from going into effect any law that is against the Constitution, even though it had been passed by the peoples' Representatives and Senators and been signed by the President of the United States.

Many and fierce are the attacks that have been made upon the Supreme Court. Politicians have leveled their guns against the dominant and overruling power of that court, just as the prerogatives and right of precedence of the Standard Revision Committee are now being fired at by De Lancey.

The A. P. A. needs its Standard Committee just as the United States Government needs its Supreme Court. Both are said to be an impediment to liberty of action. In point of fact, the power of the Supreme Court over legislation, like the power of the Revision Board over the actions of the specialty clubs, is the guarantee of the Constitution that the minority shall receive protection, and that the majority vote of the moment, swayed by passion, or prejudice, or self-interest, or sentiment, shall not register its temporary opinion as an act of permanent law against the fundamentals of the Constitution. This is a basic plan in the Constitution of the United States designed by John Marshall, who had the supreme gift of straight thinking. It is a basic plan in the Constitution of the A. P. A. There should be no tampering with this fundamental law.

What if there were no Revision Board to strike down and declare null and void such Standard changes as are sometimes adopted and endorsed by specialty clubs? What if De Lancey's scheme to destroy the authority of the A. P. A. over the Standard should win out in the election next spring?

Once the specialty clubs start out as the final arbiters and makers of valid Standards which are beyond adjustment or repeal, there will arise the greatest confusion and lack of system ever known in the purebred poultry business.

What we need is strong, centralized authority to authorize and publish

You Can Get More Eggs

Little Putnam Stove keeps water unfrozen—not hot.

Over 90% of the Egg Is WATER

Give your fowls all the pure *un-chilled* water they can drink, and watch them shell out the eggs. One of my Little Putnam Stoves will keep enough water unfrozen to supply 30 or 40 fowls, even in the coldest weather. This Stove holds 3 pints of oil—requires no attention except a monthly filling, due to my patented burner. It's fireproof and non-explosive—can be operated anywhere. You can run it all winter at a cost of from 20 to 30 cents. You'll get enough more eggs the first month to pay for it.

Little PUTNAM Stove

\$2.00
Postpaid

Little Putnam Stove

can also be used as a heating unit for an easy-to-make and easy-to-operate Oat Sprouter. Full directions for making the Sprouter are packed with every Little Putnam Stove, or I will mail a set free and promptly if you will request it, and send your dealer's name.

GUARANTEE—I guarantee the Little Putnam Stove to give satisfaction, or it may be returned in ten days and the money paid for it will be promptly refunded. Most dealers keep it. If yours does not send me his name and \$2.00, check or money-order, and I will send you a stove post-paid.

Standards. The A. P. A. fills the bill. Its jurisdiction should be strengthened, not curtailed. Let the specialty clubs do breed promotion work, which is a big and undeveloped field. Let the American Poultry Association umpire the word of Standard making, with the specialty clubs co-operating, but not dictating their breed standards with final and unalterable authority. Preserve to us the Standard Revision Committee, which the Constitution wisely charges with the responsibility of adequately protecting breed type, preserving uniformity of variety characteristics, and editing the whole Standard so as to secure uniformity of technical terms and expressions throughout the entire book.

De Lancey's catch phrase of "majority vote shall rule," is popular. It will win for him votes. Our position on this important matter may not be based on a popular argument. Be that as it may, American Poultry Journal editorially does not seek to win applause on false and temporary expediences.

Unless De Lancey modifies the tenth plan in his platform he will be looked upon by the thoughtful heads in the A. P. A. as an adventurer playing well out on the sea of popular favor. In his tenth plank, De Lancey inveighs against constituted authority, and appears to be seeking an extension of his influence by a great profession that is addressed to the prejudices and selfish interests of men.

We need something more than mere liberty of action for specialty clubs, which De Lancey proposes; we need the restraining and moderating influence of a far-seeing Standard Revision Committee. We quote below a part of the report of the Revision Committee made at the Knoxville Convention, and leave it to the reader to decide whether such a committee should be continued or whether we should curtail the legal authority of the A. P. A. over its Standard and trade off the Standard of Perfection for De Lancey's poultry club standards:

"There are many underlying principles in Standard making that, though not fully expressed in the Constitution, have been for years generally understood as being fundamental. More than that, they must be accepted as fundamental principles in Standard making, upon which the whole structure must rest, or else fall because of its own inconsistency. The most fundamental of all of these is, undoubtedly, one so simple as to be practically an axiom. This is that a breed to be entitled to the name indicative of such, must possess at least one feature or characteristic so distinctive that it may be recognized readily from all other breeds or varieties in the Standard.

"This committee was of the opinion that if we are to license judges and are to supply them with a Standard upon which to judge, that this Standard must contain provisions sufficiently definite and explicit to enable them to distinguish between breeds and varieties. And during its deliberations it conscientiously made an effort to provide such, and when such efforts have proved futile in this direction, there remained nothing to do but reject such breeds as seemed to, in a great measure, duplicate other breeds or varieties already recognized. In the opinion of the committee, breeds that have such a distinctive feature or features, that have at the same time a following, should be recognized.

"The committee recognized as a principle, the fact that breeds which are practically extinct by reason of being absent from show

**Why Pay
More?**

Here is a machine that affords many advantages not found in big capacity incubators. Each section has a separate hot water heater. If you do not have enough eggs to fill both, you can start one and any time later start the other. This also saves oil as you do not have to furnish heat in the section you are not operating.

30 Days Trial Freight Paid

You take no risk in buying this big Wisconsin Double-deck machine. It is sold on 30 days trial. If not found perfectly satisfactory you can return it at our expense and get your money back. We guarantee you will be delighted with the convenience, economy and hatching results from this big double-deck Wisconsin. Order now—get earlier chicks—bigger prices. Order direct from this ad or write for 1923 catalog. If you prefer smaller capacity machines, here they are at equally attractive, 30 day trial, freight paid prices that you cannot beat.

WINTER LAYERS

WITH TRAP-NEST RECORDS

Is the kind of poultry you should have in order to show a balance on the right side of the ledger next Spring. Our 32 years of experience in breeding and trapnesting puts us in a position to supply birds with the "lay" bred into them; birds that if given half a chance will prove to be money-makers for you this winter, as they will shell out eggs when prices are the highest. Our 32 years of successful business should convince the most skeptical that we deliver what we advertise.

Come to the Fountainhead

for either cocks, cockerels, hens or pullets in any quantity desired, and at prices any one can afford to pay.

SUNNYSIDE BIRDS

rooms or rarely seen in same for a number of years, are recognized by the Association and the description of these are published in the Standard to very little purpose and that the benefits derived to the Association, the breeders of such, or the public at large are inconsiderable.

"The committee, therefore, felt it its duty to recommend that the most flagrant of these examples be dropped from the Standard. This recommendation was made at the first meeting at Chicago and the same circulated widely throughout the poultry press so that due notice of such contemplated action has been thoroughly distributed and to date only a few protests against this section were received.

"Following instructions of a previous meeting at Kansas City, the committee has incorporated in the Standard instructions for judging capons at poultry exhibitions, which, though brief, seem to be adequate, and meet the demands of the advocates of this measure.

"The impression seems to be prevalent in the poultry world generally, that less attention is being paid and less weight being given to the practical quality of Standard bred poultry than is to the advantage of the industry in general. The Revision Committee thought it advisable to place emphasis on this phase of judging and did so by introducing several paragraphs of practical instruction on how to determine practical qualities when judging Standard poultry, as indicated by body conformation. In doing so, the committee called attention to the fact that this was done for the first time and guarded against using information that possibly may not be authentic, or in other words, it did not consider it expedient to use information that may be termed "faddish", or on the other hand, that has been peddled by other agencies and has become monotonous because of frequent repetition."

The reader will at once see that political orators, in the very nature of the case, find it difficult to counteract the solid, constructive recommendations which a studiously prepared report of this kind carries.

The Standard Committee's recommendations are not easily overridden, and they should not be.

De Lancey joins those who would thwart the influence of the Standard Committee. He evidently looks on such a committee as "steam roller," rather than as a bulwark of safety. He would throw to the winds the stabilizing effect of that branch of the Association in which judicial power over the Standard is vested. He would leave to the specialty clubs final decisions on all matters pertaining to the respective breeds. He would maintain no high court to co-ordinate the various efforts of the independent clubs, no committee to regulate opinions and combine ideas, so as to secure that harmonious adjustment that today gives to the Standard the symmetry of perfection.

Friends, De Lancey is plumb wrong. He should either get out his plane and smooth off that rough old plank ten he has spiked down in his platform, or he should get busy and convince his public that we have placed too important a construction on words which admit of no other meaning.

A New Constitution

Last March, Henry P. Schwab addressed a petition to the A. P. A. asking that a committee be appointed to revise the constitution of the Association. The Association in convention at Knoxville last August instructed its President to appoint a committee of five to revise the constitution. Up to the present time no appointments to that committee have been announced. If the President had intended to carry out a vigorous reorganization, he would have promptly appointed a strong committee.

Use Oakes Electric Hen

Oakes also manufactures a Hot Water Incubator and complete line of Better Poultry Supplies. See your dealer or write us direct.

*It Hatches Better---
And Does It Easier*

YOU will like the new Oakes Electric Hen. It is compact, convenient and a wonderful hatcher. There's no dust or dirt, no smoky lamps, no fire hazard—just absolutely automatic operation and lots of strong, husky chicks. The Oakes Electric Hen may be operated on any current anywhere. The cost is reasonable and these remarkable machines may be converted into hovers when desired. Be sure you get an Oakes Electric Hen from your dealer—or order direct from factory. Write today for catalog and prices.

LADY LAYER

Laid 326 Eggs in One Year

H. Cecil Sheppard, Candidate for President American Poultry Association

The American Poultry Association is offered the services of one of the biggest, brainiest and most successful breeders of pure bred poultry in America. H. Cecil Sheppard, Berea, Ohio, telegraphed November 16th:

"Since you believe I can be of some service to the American Poultry Association and the poultry industry in general you have my permission to announce my name as candidate for President of the American Poultry Association.—H. Cecil Sheppard."

Every one interested in the progress of Standard bred poultry can congratulate themselves that a man of Mr. Sheppard's calibre and ability has consented to sacrifice the time and energy necessary to head the American Poultry Association.

American Poultry Journal stands unqualifiedly back of H. Cecil Sheppard for nomination and election to the Presidency. He is a man who faces facts and deals squarely with facts. He is not a politician. He is, in every sense, a business man and a poultry breeder. He has built up, on his own farm, one of the greatest poultry breeding establishments in the world. He will give to the American Poultry Association, at this critical and important time, the common-sense business administration that is sorely needed.

The first thing on Mr. Sheppard's program will be to pattern after the Presidents of the United States, from Washington down to the present time, and call to his aid a cabinet of the strongest, most forward-thinking men in the poultry fraternity. He not only knows the meaning of economy in business administration, but he is no pussy-footer nor side-stepper. He will bring to the office of President that active leadership which will ripen into fruitful progress.

The opportunity is now open for members of A. P. A. to cast their ballots for a man who has the business capacity, the energy and the willingness to make the American Poultry Association the great, forceful Association of breeders that it should be. Every member of the A. P. A. who is engaged in the breeding of poultry should think twice on this opportunity to nominate and elect a REAL MAN to the Presidency of the American Poultry Association.

Believing his election paramount to the interests of the poultry industry, we respectfully endorse H. Cecil Sheppard, Berea, Ohio for President.

Wonderful Values

I am shipping out at this time. I do not believe there ever were as many good birds on the farm as there are now.

Take Your Pick

Come to my farm, look over the stock with me, take your pick of the birds. If you can't do that, my 100 page catalog will prove almost as interesting and helpful as an actual visit. Send for the catalog. It costs you nothing. I will pay its fare.

It brings my entire proposition right to your own table. Look it over. See how many letters and pictures I have from delighted customers. Customers who are joyous because they have won at a state fair or poultry show. Customers who are proud because every one admires their Sheppard's "Famous" Anconas. Customers who are downright pleased with the way Sheppard's "Famous" Anconas lay plenty of big white eggs during the winter when prices are higher and when hen fruit goes so well with nicely cured ham and bacon.

Come, look over the farm with me—do it by means of the catalog if you can't come in person. You will be interested in the "Famous" story from the time you set your eyes on that saucy fellow on the cover, right through a stack of letters in the rear. It's a story that tells you definitely how to enjoy more pleasure and take more profit from chickens. Send for it!

One of these young ladies will write your name and address on the envelope and get it out to you right away.

H. CECIL SHEPPARD

President International Ancona Club

BOX 527

Something to Think About

Elsewhere in this issue appears an article headed "Cockerel Consignment of Bradford County." This article was prepared by Paul A. Seese, Ass't County Agent of Bradford County, Pennsylvania. It is a syndicated article which was mailed to the entire agricultural press. We reluctantly give space to mimeographed copy of this kind, but the big message contained in this particular article is too important to be thrown into the waste-paper basket.

Note as you read this article the names of the men in state employ who co-operated in this cockerel sale. Take note of the fact that the birds sold in the auction sale were selected by a man drawing his salary from state funds. Reflect on the fact that the auction sale of cockerels was staged by a county agent who draws part of his salary from a fund supplied by the National Government in Washington. Observe that every cockerel sold in the sale is "eligible to mate with hens passed for the Advanced Breeding Project which is in operation at the present time throughout Pennsylvania." That breeding project is similar to other projects which are being promoted and supported by the state agricultural colleges in New York, Missouri and other states that have a progressive poultry department at their state institutions.

Things are moving fast in the poultry world. State and government money is being liberally appropriated and wisely spent for poultry work. Educated and honorable men who are ambitious to be of service to poultry keepers are administering the many poultry projects. Poultry extension men are everywhere. The time is here to wake up to these new movements. Conditions are not like they were twenty years ago, nor five years ago.

Read the article, "Cockerel Consignment of Bradford County," note the co-operation given the project, and then reflect on the attitude of the present political organization which now has the princely opportunity to step forward in the great work of fostering the breeding interests of the entire country.

Surely no forward-looking breeder who sees the opportunities that lie open in this industry, can read with passive assent the following expressions from Harry Collier, member of the Executive Board of the A. P. A.:

"I realize that the American Poultry Association has little of anything to sell except enthusiasm. When you run out of that ingredient you have lost your big chance. I have taken thousands of members and hope to get a thousand more before I die. I have never taken one member as a business proposition. I found some man or woman who had a bunch of enthusiasm the same as I have for the organization. It was easy to sell these people a membership but when a man or woman asked me how they would be paid in dollars and cents for joining, I just hunted up another fellow who would not ask such difficult questions. When you take the sentiment out of the association that has held it together so long, then you so cheapen it that no man or woman can be shown where it would pay them to join. But just get up a lot of enthusiastic feeling for the organization, use a little psychology and any good poultryman will join, but be sure and forget all about money, except the five or twenty-five dollars that you get for the membership. As a business proposition, you have nothing to sell."

That is at once the most sweeping confession and most severe condemnation that has ever been registered against the purposes, the work, the hopes of the American Poultry Association. It comes from a Director of the Association who last year secured over one hundred new members. It is convincing testimony that there is no longer any vision in the direction of affairs. It confirms us in the belief that there should be a house cleaning from cellar to garret, that out of the new brains, new ideals, new programs that are being introduced into the poultry field there may be rebuilt a stronger, more modern structure.

Egg Laying Contest Winnings for year closing November 1, 1922, again show the Superiority of **Hollywood Strain**.

Storrs, Conn.—**Winning Pen**. This is probably the most coveted win in all America.

Bergen County, New Jersey, International Egg Laying and Breeding Contest (three years contest), **Winning Pen** for grand Total of Eggs Laid in 104 weeks, showing the wonderful two-year laying qualities of our strain.

The Vineland International Egg Laying and Breeding Contest (three years contest), **Winning Leghorn Pen** and **Second Pen**. This pen was reproduced by the management of the Contest from our pen that won First Leghorn Pen in 1919-1920, thus showing the ability of our strain to reproduce itself in the hands of others.

Mr. Poultryman:

We are a long distance from most of you but we want your patronage. We are doing everything possible to prove to you that we have *The Greatest of All Laying Strains*.

Do you realize that for seven years Hollywood Strain has been winning with surprising regularity Egg Laying Contests open to all the world. Each and every year we have been in the winning list.

We have won one year Contests.
We have won two year Contests.
We have won three year Contests.

We have won five pullet Contests.
We have won ten pullet Contests.
We have won twenty pullet Contests.

No other breeder has ever approached our Public Competition Record. Consistent High Flock average is the **Greatest Virtue** any Strain can possibly possess. Our strains have surprised the Poultry World with its consistent and high yield made in Egg Laying Contests. Investigate our claims and the claims of others. Compare them and we feel sure we will be favored with your order. If so, we guarantee all orders to arrive in good condition and to satisfy you.

Breeding Stock and Layers For Sale

We have the finest lot of Breeding Cocks, Cockerels, Hens, Pullets and mated pens ever offered by us. All of them are closely related to our Contest Winners.

H. B. HARK, Mgr.

GLENDAL, OHIO

Early Molters

T. W. Noland, director of poultry work, at the Missouri Poultry Experiment Station, Mountain Grove, where the National Egg Laying Contest has been held for years, is out with the statement that "time of molt does not determine winter nor yearly egg production, so culling should not be based alone on time of molt."

Director Noland does not say that all early molting hens are good layers, but he does say that thousands of good birds in the state of Missouri have been culled out on the mistaken idea that all early molters are poor hens. He jumps with both feet on the reports of county agents and poultry specialists who go into farm flocks in the fall, and cull out the hens that have dried up and are not laying, and then figure the profits saved to the poultry keepers. He maintains that thousands of useful hens have been sold on the market as culls simply because they were not laying at the time of culling.

Some years ago this writer culled a flock of Rhode Island Reds. The birds culled out were put in a separate pen, but instead of being sent to market, were retained by the owner and given special care and feed. They received plenty of skim milk, were housed in a modern sunshine poultry house, and by January were giving a good account of themselves in egg yield.

We were called in to mate up those birds during the week of the poultry show that was held in January. It was a surprise to see those "cull" hens with green leg bands on, just about as fresh in appearance and action and as full in body development as the "good" hens with red leg bands. The change was due to feed and care.

It is not possible to transform every cull into a good layer, and culling is doing a great deal of good. However, mistakes are being made. Experience has taught us that molt and condition are largely dependent upon feed and care. We would never again cull a flock without first observing conditions under which the birds are kept and then making note of the kind of feed being rationed to them. If the birds are getting milk, or mash which likewise provides an animal protein supplement, the molt will be much later in the fall than though the birds are strictly grain fed. A classic example of this was the flock of early molting White Rocks at the Purdue Agricultural College, Indiana. The birds had been grain fed, molted early, and finished their year with the ordinary egg record of six or seven dozen eggs per bird. Then those early molters were put on a ration that was balanced by the addition of buttermilk, and as hens they outlaid their pullet year and became late molters.

We have long felt that culling as being practical to-day is a better indication of the birds egg record for the past year, than an indication of what the bird is capable of doing the coming year. If you do your own culling, know your own birds, are familiar with their age and the system of feeding employed throughout the year, then molting and pigmentation may become valuable aids in culling. But for the professional culler or the utility judge, working on birds he has never seen before, there is danger of misjudging the potential capacity of the future by those outward signs which are the result of past feeding and management.

Director Noland has run a few experiments at Mountain Grove to determine just how well the time of molt could be used as a basis on which to predict future performance of the birds. In his last experiment, he took ten early molters, started the traps on them June 23, 1921 and ran the test through to June 23, 1922. The ten were molting in June when the experiment was started.

They laid 1,562 eggs during the test year, an average of 156 per hen, although they were two year olds. It should be added that two of the birds died, one in December, another in May, and for the eight hens that had a chance to get in a full year the egg yield averaged 173 eggs per hen.

Director Noland sums up the results of his studies and experimentation by saying that careful consideration should be given to the "shrink" in hens, which may be due to feeding or the gradual contraction of the pelvic

HATCHERS !

Don't ignore the demand for Wishbone Hatched Chicks

IT is a fact that it is easier to sell Wishbone-hatched chicks than any other kind. And it is also a fact that in producing those chicks—in addition to getting healthier, more livable chicks—you actually save money, time, and an enormous amount of worry.

There is still time to get your share of this season's Wishbone profits. Make up your mind to get a Wishbone right away.

The Wishbone costs less to operate, because it cuts fuel bills and requires less labor and less time. The Wishbone requires so little attention that hatchers call it the "Let 'em alone" machine. The Wishbone gives you more capacity per square foot than any other incubator. (Tell us the size of your space and we'll prove that). *And the new 1923 Wishbone has eliminated all hand labor from hatching. You don't touch a tray or transfer an egg from the time you put the eggs in until you take your chicks out.*

Send for the catalog. You ought to find out about these recent improvements. You will be amazed at the perfection of the 1923 Wishbone. Write for the free catalog.

IF you want to be sure to make money—if you want to know in advance that your chicks will live and grow into fine healthy chickens—insist on getting Wishbone-hatched chicks. The healthiest, most livable chicks that ever quit the shell are incubated in Wishbone Mammoths. They weigh more, they reach you in perfect condition, and they're hardier.

Wishbone-hatched chicks are famous among poultry raisers everywhere. By actual comparison, they have been shown to grow better, develop faster, and average much smaller losses.

Wishbone-hatched chicks cost no more than other chicks. The secret lies in the Wishbone process of incubation. The eggs are rolled during the hatching period the same as the mother hen rolls them—and temperature and moisture are so regulated that the eggs receive better care than a mother hen could give them.

Order your baby chicks from a hatchery equipped with Wishbone Mammoths. You will find it a mighty good investment. Drop us a line and we will gladly give you the name of a Wishbone operator in your neighborhood.

"Viking" Strain Rhode Island Whites

Just Admitted to The Standard

World's Greatest Profit Producers

READ THIS:

1—They LAY MORE eggs than any other breed of chickens!

Put them side by side with ANY other flock of chickens, such as Leghorns, Anconas, Plymouth Rocks, Reds, Orpingtons, Wyandottes, etc., and the Rhode Island Whites positively will lay MORE eggs than ANY of them. They are, moreover, wonderful Winter Layers, when eggs are highest in price. Rhode Island Whites are making greater average laying records in the leading contests of America than any other breed of poultry.

2—They are as good market chickens as Plymouth Rocks!

About the same weight as Plymouth Rocks, they have rich, golden yellow skin, juicy, tender meat and plenty of it—a real delicacy on the table. They command the very highest prices as Market Fowl.

3—They are beautiful, prize-winning shows birds.

Just picture to yourself, flocks of chickens as pure white as the driven snow, with bright red heads, golden yellow beaks and legs, stylish and proud, with nice, full bodies and elegant finish. Ah! they are indeed beauties. The Viking R. I. Whites are winning out in the largest shows of the entire country.

4—They are quick maturing, easily raised.

Easily confined in low fences. IN FACT, HAVE MORE GOOD QUALITIES THAN ANY OTHER CHICKENS THUS FAR PRODUCED. This broad and sweeping statement is proven and backed by every well-kept flock of Rhode Island Whites in the country.

5—Very special introductory prices RIGHT NOW!

In order to introduce these Wonder Chickens as quickly as possible into many different localities, I am giving SPECIAL introductory prices on first orders. Remember, THIS IS THE INTERNATIONAL HEADQUARTERS FOR THE BEST R. I. WHITES IN THE WORLD.

Investigate this wonder breed! It will surely repay you! Mail this coupon today!

bones and abdomen in the rest period of the fall, and more attention paid to width of back, shape of pelvic bones and quality of skin on abdomen. He also lays stress on vitality.

This is in line with the text for the new Standard which, unhappily, promises to be late as usual; but, after all once it is ready, it will stand until 1932. In that book, the Revision Committee has included a new paragraph instructing judges to handle all birds for back shape, also shape of abdomen. The factors of molt and pigmentation are referred to as interesting and sometimes valuable points in culling. It was thought that they were too faddish to be included as a part of the Standard text. On at least one of these points, that of molting, Director Noland bears witness to the judgment of the Revision Committee.

Theo. Hewes recently said to this writer: "I don't think that people generally realize how far we went in the new Standard. We included the basic things about utility. After that new Standard is in force, there will be no need for separate utility classes in the Chicago show. The fundamental things about utility will be a part of the judging in the Standard exhibition classes. I will then not continue the utility class unless there is a big demand for it. Of course, a poultry show is a mirror that reflects the public tastes and the public demands, and as a show manager it is my business, within reasonable limits, to provide classes for what exhibitors desire to enter; but it seems to me that there will be no need for utility classes after the new Standard is out and breeders and judges alike have the opportunity to see what practical advances have been made."

Making Room for Utility

In a leading article in the November 4th issue of the Country Gentleman, said article being entitled "Handsome Is As Handsome Does—Not Alone Fine Feathers But the Ability to Lay Eggs Make the Bird," written by Harry R. Lewis, chicken farmer at Davisville, Rhode Island, President of the International Baby Chick Association, and formerly Professor of Poultry Husbandry at the New Jersey Agricultural College,—that author says:

"For a number of years leading organization, it has offered to co-operate in the conduct the American Poultry Association to add to its Standard of Perfection a section or a chapter dealing with production values. A committee of this body, a year ago, recommended that such action be taken, and the association at its Seattle convention last year authorized the officers to proceed with the work. The Standard Revision Committee failed to recommend the addition of such a section to the Standard. They did, however, place in the instructions to judges a section describing the conformation and characters which should be especially looked to from a production standard. This is a gratifying step in the right direction.

"The American Association of Instructors and Investigators in Poultry Husbandry from its beginning has been influential in developing the economic factors of poultry. From time to time, through its connection with committees of the American Poultry Association, it has offered to co-operate in the compiling of material for the Standard. These offers have been without result.

"So the Association of Poultry Instructors voted at their recent Seattle convention to issue a production manual, fully illustrated and containing the most authentic information on the selection and judging of poultry for egg production.

"Through the influence of the Poultry Instructors' Association, the officials of American and Canadian egg-laying contests and breed-testing projects were, three years ago, organized into the American Record of Performance Council.

"Thus the Association of Poultry Instructors and Investigators in Poultry Husbandry is working always for the sound development of our poultry industry along production lines."

Aside from the controversial nature of Mr. Lewis' statements, two facts stand out as being of great importance.

First, the fact that the American Poultry Association has made it a part of judging by the new Standard to be issued in 1923, to

"O. K. Sanitary Poultry Litter"

"Worth Its Weight in Gold"

Oct. 11th, 1922.

The O. K. Company,
New York City.
Gentlemen:—

I just got 350 Rocks for fryers at Christmas and honestly the litter is worth its weight in gold. No dampness, and how they make it fly, and no deaths from eating fibrous material. Not a bit of bad odor; no lice or mites and a fine dusting place.

I have also used it for nests and it sure is fine.
Alvin, Tex.

Douglas Hayden.

\$1 brings you a sample bag postpaid. Covers 8 sq. ft. 2 in. deep. Large bale covers 80 sq. ft. 3 in. deep, \$4.00 F. O. B. Principal Cities. Don't fail to use this unequalled Litter this winter. It is satisfying thousands. Send for the sample bale and our new book. Act now!

The O. K. Company, 159 Water St., New York

Free Book Tells How

handle the birds and examine them for those fundamental characters and qualities of body type that indicate production values so as to make impossible the awarding of high prizes in important shows to birds that the utility breeder would consign to the shambles.

Second, the fact that the Association of Poultry Instructors and Investigators will establish a production manual and publish it as a Standard for the judging of birds in utility classes.

Since the first "Judging School" was conducted at Cornell University in 1918, a number of the college professors of the different states, particularly Philips of Indiana, Halpin of Wisconsin, Lewis of New Jersey, Graham of Ontario, and Kirkpatrick of Connecticut have met annually at Cornell with Professor Rice and his associates, to formulate, revise and approve "A Method of Judging Fowls for Egg Production," said method having to do with type, texture of skin on abdomen, molting, pigmentation, etc. In publishing this method in the form of a manual, they are simply elaborating and making available for general distribution what is being taught to students in agricultural colleges, and what has become a well established culling practice.

Because this manual is to become a handbook for "judging" it is fraught with potential possibilities. We do not want a split. We do not want utility and fancy values divorced from one another and traveling parallel lines which never meet. We want to preserve the wonderful work of the fancier and then make sure that there are no limitations or impediments placed on the shape or capacity of the Standard birds.

The 1923 Standard meets the demands of utility. Birds judged by it will not be judged by old feather, since the time of molting is largely dependent upon feeding and management. But, hens whose shanks have faded as a result of loss of fat due to heavy laying, are not to be cut for leg color, for fading with age will be allowed. Both males and females in the egg or dual-purpose breeds are to be required to have backs and bodies of such shapes as conform to the requirements of production. No White Leghorn or White Wyandotte hen with flat-iron hips or a tightly tucked up abdomen, or a long head, will get under the ribbons placed according to the 1923 Standard, any more than she would win out in a strictly utility show.

The American Poultry Association did not include these advanced instructions in the 1915 Standard, because nothing on the subject was well enough known at that time to be accepted as orthodox. It is unfair to criticize for what was then unknown. It would be only fair to criticize if what is now known about the correlation of body type to production had been ignored in drafting the new Standard.

The 1923 Standard goes farther than instructing judges to handle the birds for back and body shape; and setting forth the practical kind of backs and bodies of which the ideal specimens should be possessed. In making the 1923 Standard, it was realized that the breeding of feather markings should be simplified as far as possible, in accordance with the known tendencies of inheritance, and that aesthetic standards of color should not be set which require extreme matings to produce. The course pursued by the Standard makers was to include the basic things about utility, and to make room for the added value of practical points by simplifying and making more easy the production of the points of beauty.

There is every reason why every breeding interest should come together under the 1923 Standard of Perfection. Let us all strive to make the American Poultry Association, which issues the Standard, a great breeders organization, representative of the breeding industry. Such projects as Mr. Lewis refers to as the egg contest and breed-testing projects, and the certification of high producers so as to lift them out of the realm of pipe dreams, together with the promotion of the breeding of Standardbred poultry, should all come under the supervision of this great breeder's organization.

Whatever committee is appointed by President Rigg to revise the constitution of the A. P. A., it should be selected with a view to doing the same kind of big, progressive work that was done by the Standard Revision

5-in-1 Feeders

Pay for Themselves in Four Months

KEEP a constant supply of egg-making materials—egg mash, meat scrap, charcoal, grit, oyster shell—before your hens ALL THE TIME if you want winter eggs!

Self-feed with a Jamesway 5-in-1 Feeder, which supplies everything a hen needs, without waste. The egg mash saved in the overflow pans will pay for your feeder in less than four months' time.

Or, as George E. Good, of Waveland, Indiana, says: "If you are wintering only 40 hens, add 10 more and they won't cost you a cent for feed. You can keep them on the feed saved by the feed saver pans."

Everybody knows Knapp's Hatchery of Shelby, Ohio. Here is what Mr. Knapp says: "Your Jamesway dry mash feeders have been in use constantly for the past year and as a result I believe that there has not been one ounce of feed wasted. The best thing of its kind I have ever seen."

Jamesway Poultry Equipment

is practical, durable equipment, built for the poultry raiser who is trying to decrease his costs and increase his profits. It saves time, saves work, saves feed, and helps wonderfully in getting more winter eggs.

Jamesway 5-in-1 Feeders are solidly built of heavy, best quality, Keystone copper-bearing, rust-resisting, galvanized steel sheets. Set up off the floor. Tilting tops prevent roosting. Feed charcoal, grit, oyster shell, egg mash. Two sizes. Large size self-feeds 150 hens one week without re-filling. Small size feeds 75 birds. Egg Makers—Feed Savers—Labor Savers—Time Savers—Profit Makers!

Quality made, by the largest manufacturers of labor-saving barn equipment in the world, for practical poultry raisers.

Ventilate The Jamesway

Is your house wet? Is it cold? Do you have to freeze your house dry? Is cold and excessive moisture limiting the production of your hens, subjecting them to colds, roup, and other ailments?

Would you like to know how to put four walls around your house instead of only three? Would you like to know how to get a good circulation of clean air without harmful drafts?

Then ask us to reserve for you a copy of our new book on Poultry House Ventilation, which will soon be off the press. Ask for book No. 42. Free—no obligation. Address—

World's Greatest Hatcher of

EVERY SEASON the Candee gives added proof that Candee hatched chicks are the quality chicks that live and grow. Today the Candee continues to stand supreme in these essential features:

TRUE SECTIONAL CONSTRUCTION, making it the easiest to install and to enlarge without loss.

PATENTED DOUBLE HEAT CONTROL, assuring double protection against overheating.

AUTOMATIC EGG TURNER, by which all of the eggs can be turned in from two to five seconds.

DOUBLE DECK CONSTRUCTION, permitting large installations in small space.

POSITIVE COOLING OF EGGS, by opening the compartment doors without overheating other compartments.

Thus the Candee requires the least time and attention and its record of results shows that more Candee hatched chicks are raised to maturity, which is the supreme test of incubation.

The Candee Superior Features

THE CANDEE with its patented double heat regulation bars the surplus heat from each egg chamber, as contrasted with all other types where all of the heat is piped through the egg chambers and the overheated air allowed to escape, carrying the natural moisture with it.

Eggs can be cooled, if desired, in the Candee (and the most successful operators practice long cooling) in contrast with other types where cooling is impossible.

In the Candee double deck, each deck has its own heater, and each deck is a complete separate machine. This results in economy of operation, assures safety and prevents the hottest water from rising in the upper deck, at the expense of the lower deck.

Candee double-deck 20,400 egg capacity, equipped with automatic egg turner. All eggs needing turning can be turned in eight seconds' time. The only time eggs are handled is in testing out the infertiles.

SEND FOR OUR FREE CATALOGUE

This is an instructive book, explaining Candee principles of incubation, showing pictures of hundreds of successful poultry plants.

Anyone planning to sell Baby Chicks or to do Custom Hatching should send for this large free catalogue.

Always Stands the Test—A Quality Hatcher of Quality Chicks

CANDEE INCUBATOR & BROODER COMPANY, Eastwood, New York:

Hollywood Poultry Farm, Hollywood, Wash., Sept. 20, 1922.

We are using the Candee incubator with continued success, after a test of years. First, we installed a 3,000-egg Candee which did good work for us, with the result that later we put in two more sections of equal capacity, giving us a total Candee equipment of 9,000 eggs, and it is in these machines that, for years, we have hatched eggs from our highest record layers, including many winners at the best known egg-laying contests of the United States, embracing the National at Mountain Grove, Mo., the International at Vineland, New Jersey, also the contests at Storrs, Conn., Georgetown, Del., Santa Cruz, Calif., and Puyallup, Wash.

To date we hold several American and World records, including highest Leghorn hen (315 eggs)—official score at the Western Washington Egg-Laying Contest; the World's individual home-plant record for a Leghorn—336 eggs in 365 consecutive days, and the still greater World record of a 300-egg hen (No. 1284) that in a single generation was the mother of four daughters, each of which laid 300 eggs or even one 300-egg daughter or better.

The eggs from all these record hens, themselves priceless, and mated with males that also are not for sale at any price, we entrust every season to our Candee incubators, doing so because of their convenience for accurate pedigree work and because the chicks hatched year after year therefrom are of satisfactory quality in size, health and vigor.

HOLLYWOOD POULTRY FARM, By M. E. Atkinson.

CANDEE INCUBATOR & BROODER CO.,

World's Greatest Egg Layers

Hollywood hen which laid 336 eggs in 365 consecutive days, a world record

Hollywood hen which laid 315 eggs at Western Wash. egg laying contest 1920-21

FIRST ON THE MARKET as a mammoth hatching machine, the Candee years ago was standardized in every essential factor and principle for the successful production of high percentages of large healthy, livable chicks.

CANDEE MACHINES built a dozen years ago are still in successful use and frequently plants have Candees in single or double decks that have been bought in several different years, the size being increased by adding extra sections, as the customer's business grew.

The Very Last Word in Refinement

THE 1923 MODEL CANDEES are equipped with the simplest, most practical egg turner yet devised. One master lever on each side of the machine turns all of the eggs needing turning in a few seconds. It therefore becomes practical to turn the eggs several times a day, especially from the second to the twelfth day and thus secure larger hatches. Any tray can be disconnected in an instant and it will remain stationary or can be removed.

Start With Any Size Candee

CANDEE SECTIONS contain two 300-egg compartments, each of which can be set and run at different times. The smallest size Candee is a heater and a 600-egg section. The next size is a heater and two sections, 1200-egg capacity, etc. All of the sections exactly fit and more can be added at any time. When the heater becomes too small, a larger heater is supplied free with the extra sections.

Every size Candee is a proved success.

Candee sections are shipped all built and installation is only a matter of a few hours time. Any handy man can set the Candee on its legs and connect up the sections. A section will go through any ordinary sized door, which is an important feature.

Famous Hollywood Hen No. 1284, which laid 300 eggs and produced in one season these four daughters, each of which laid 300 or more eggs in 365 consecutive days—also a world record. Eggs from these hens are hatched every year at Hollywood Poultry Farm in Candee Incubators. See report to that effect herewith.

A Record of Years of Use

A Candee installation has back of it the record of success of thousands of users in the United States and Canada, and several foreign countries.

The equipment used by Hollywood Farm is the regular Candee construction. The first installation was a 6000-egg (ten section) Candee. This proved too small and later five more sections were added, making the total capacity 9,000 eggs. Thus they have thirty 300-egg compartments, each of which can be set separately and run independently but all getting hot water heat from one heater.

Send for FREE Catalog

Dept. 2,

Candee Colony Brooder

Broods up to 500 chicks in one flock in one building, with only one heater and one coal fire to attend. Big and quick heating. Its coal magazine, big fire bowl and large, 12-inch grate keep the fire burning over night and all the time.

ALL ABOUT LEGHORNS

Remarkable Book FREE

**Remarkable New Book,
just off the press "All About
Leghorns" Sent Free to every-
one who mails coupon below.**

Everybody who owns Leghorns should send for this remarkable new book at once. It contains the latest and best information ever published on the **World's Greatest Layers**. It will help you more than anything else to become successful and make more money with Leghorns.

21 Subjects Thoroughly Discussed

How to mate and breed Leghorns. How to judge Leghorns. How to condition Leghorns for the show. How to wash White Leghorns. What and How to feed Leghorns. How to prepare a balanced ration for Leghorns. How to produce a strain of heavy layers. How to increase egg production through the use of artificial light. How to obtain highest prices for Leghorn eggs. How to care for baby chicks. How to feed Leghorns at all ages. How to obtain best results under farm conditions. How to mate Buff Leghorns for color. How to select the high egg producers. How to build a modern egg farm. How to properly rear Leghorn chicks. How to build a winter egg strain. How, when and where to advertise. What to consider in mating Brown Leghorns. How to select the males that produce high egg record females.

This last subject is of special importance to every breeder. It is not sufficient to have only a few high producing females. It's a whole flock of them that makes you money. Since the male bird is half the flock, it's the science of selecting males which will produce high egg record females that makes you successful. This subject tells how.

Special Subjects on Poultry Diseases

Special subjects on How to Prevent and Cure Bumble Foot—How to Combat Lice and Mites—How to Treat Diseases of Leghorns—How to Prevent and Treat Poultry Diseases through Vaccination. This information alone is worth more than \$10 to anyone.

Send for This Great Book Today

You must see a copy of this wonderful book to appreciate its value. It is a real encyclopedia on Leghorns. The book is not sold. But we want to invest in new friends; and will give you the book absolutely free if you mail the coupon with \$1.00 for a three year subscription to

The Leghorn World

Official organ of all Leghorn specialty clubs and only publication in world devoted exclusively to all varieties of Leghorns. Published monthly, 50c year, 3 years, \$1.00. Old subscribers say they would not be without it for \$5.00 a year. It keeps you in touch with leading Leghorn breeders and keeps you posted on everything pertaining to Leghorns. Tells how to make big money with them, how to buy, sell, get greatest pleasure, most profit; everything you want to know about Leghorns. The book and magazine should help you make a wonderful success. **Don't lay this advertisement aside; but take out your dollar bill right now; pin it to the coupon; sign and mail at our risk and get The Leghorn World every month for 3 years and "All About Leghorns" free.**

Committee, that the A. P. A. may become the one central force in the poultry breeding world.

The 1923 Standard of Perfection opens up new possibilities and something more than a 2x4 organization is needed. First of all there should be a job opened for a managing executive who can see the work to be done and who is capable of enlisting in that work the true friends of advanced poultry culture.

Committee on Judges' Licenses

There is one committee that has power with authority. In this respect it is greater than the Standard Committee, which can only recommend.

The Committee on Judges' Licenses is one that acts on its own initiative. It makes its own rules. It stands its own ground. It neither receives instructions from the parent body of the A. P. A. nor does it have to submit its report to open debate. It acts and then tells what it has done.

Because of the power of the Committee on Judges' Licenses, and because of the need there is for stamping out incompetence and regulating irregulars, the three judges who sit on this committee, Messrs. Hale, Hackett and Tallant, are men of importance in the poultry show system.

As a rule we do not give space to printing the names of A. P. A. committees in these columns. The committees never met, the members do no work, even the chairman may or may not render a report. If real work is to be done, the President may be expected to rush off the names of a special committee appointed just for the special purpose, while the old appointees lie as still as sardines in a can.

In order to get on one of the standing committees you must qualify in the mystifying game of American Politics. One qualification appears to be residence at any of the ends of the earth; and, judging from the fact that on one committee of three, there are two men who haven't attended an A. P. A. convention in five years, absenteeism is a special recommendation.

The committee on judges, however, is like the Standard Committee in that it amounts to something. And, amounting to something, it is important that it should be a committee of fearless leadership and honest thinking. Fortunately it has as its chairman a man of qualifications that fit him for the job.

In recent conversation with Judge D. E. Hale, chairman of the Committee on Judges' Licenses, Mr. Hale said:

"My predecessor, E. C. Branch, did good work. He created a respect for licensed judges such as never existed before. I consider it a compliment to succeed Judge Branch as chairman of this important committee.

"To get a judge's license today means that a man is competent, and to hold means that he is upright.

"We have the power to make our own examinations. We go ahead on our own initiative.

"Branch put out fifty questions. I am putting out a hundred. But I claim that the examinations for a general license should be made up of two hundred written questions.

"An applicant has to get a grade of 85% on those questions. That is, he has to answer right eighty-five questions out of the hundred. It is funny how some of the boys fall down hard on simple questions. For instance, I ask what is the difference between the breast color of a Silver Penciled male and a Silver Laced male. It is astonishing how many will answer: No difference.

"Some old judges and some would be judges poke fun at the licensing of poultrymen to judge shows. Some of the jokers couldn't pass an examination themselves; some of them I wouldn't list as judges at the National Show, of which I am secretary, if I could get their services free. As a judge and show manager, I positively know that the examination for a license is a good thing. It makes young judges study their Standard, who otherwise would have no incentive to dig down into it and study it hard. It reveals to some of them how little they know and sends them back to their studies. But aside from its negative feature, the big positive fact is that it recognizes ability when it does appear.

"Sometimes a candidate passes the exami-

nation in scoring, for in addition to the written examination, he must score 20 birds, also place some specimens by the comparison system of judging. In case an applicant falls down on one part of his examination, but passes the other part, he is entitled to a second examination at a later date.

"This work is doing more to command respect for licensed judges and the modern system of judging, than anything ever done by the A. P. A. I impress on the boys who apply for a license that while two experienced exhibitors may argue as to the good and bad points of a bird, just the same as two lawyers may argue a case, the judge must know the law and render his decisions based on the law, and be able to cite his reasons why. We aren't living in the days of cob-rolling, pumpkin-show stuff. Men are putting brains, time and money into breeding chickens, and our young judges, as they come on, must be qualified for the high position of judgeship.

"I feel that the judge should not only know chickens, but he should know how to handle himself. One of the questions I ask is this: What would you do in case an exhibitor asked your opinion on a bird in a class which you did not judge? That question is not answered in the Standard, but I claim as a matter of common law, no exhibitor has a privilege to ask such a question, and no judge has a right to comply with such a request.

"Another question is: On what grounds may an exhibitor protest the decision of the judge? This question is answered in Rule 13 of the A. P. A. Show Rules, which reads: 'Protests are to be entertained only in cases of apparent dishonesty, ignorance or carelessness on the part of the judge.' It is surprising how few applicants know that rule.

"It is to overcome 'dishonesty, ignorance and carelessness,' and put in their place honesty, knowledge and accuracy, that brought this Judges' License committee into being in the first place.

"The work of this committee in examining candidates is doing more than anything that ever happened to make judges respect the Standard and study it.

"I read my Standard through twice every fall before I start out on the judging circuit. My old book is pretty well worn out. I know there are judges who haven't opened their Standard in ten years, but they will not live forever, and the new men who are coming on will be so well qualified that they will force ahead rapidly. These new men who come up under the present licensing system will be trained in the Standard text, and that will mean that they will follow the Standard. The best brains in the American Poultry Association for half a century have been devoted to making the Standard, and to know that book is to respect and follow it."

"To follow the Standard is to kill off the bobbies, including feathering on the sides of Orpingtons that rounds out like globes."

Will Attend Crystal Palace Show, London

D. Lincoln Orr, Secretary of the Madison Square Garden, Show, New York City, sailed Nov. 28th, on S. S. President Washington for England, where he will attend the classic English event, the Crystal Palace Show, held annually in London. Mr. Orr writes:

"I will be there ahead of time for I want to see them receive the hampers, put up the cages; and I want to watch the judge's work. In short, I want to see how they do things from beginning to end. I will have letters that will get me behind the scenes. James Glasgow, poultryman for T. A. Havemeyer, President of the Garden Show, will be there also, although we cannot go together for he goes earlier. I plan to have him go over all the bantams thoroughly and perhaps we will go over the large poultry together. Better come along for I have a whole stateroom to myself."

Link will learn some things in England. He will not order pie more than once in the restaurant in the old glass domed building called the Crystal Palace, for he will get a cold meat pie instead of mother's pumpkin pie. After several weeks abroad he will come home with a new fondness and affection for U. S. A.

Hatch with Electricity

Convert Your Incubator Into a Modern Electric

Steady heat. No fumes. No work or worry.

It takes but a few moments to put the Lectro-hatch Electric Incubator Element into your old machine, and there you are, ready to hatch with electricity.

Think what it means to turn an electric button and let electricity hatch your chicks in an incubator that regulates its own heat and needs no watching.

Clean! Safe! Sure!

The Lectro-hatch is so clean, simple and odorless that you can keep it anywhere in your home. It has no lamp to fill, no wick to trim, no smoke, no soot, no risk of fire or explosion.

So far as temperature is concerned, you can leave it for days at a time. The weather may change, but the temperature in your incubator will be exactly what it was when you left it. You adjust the Lectro-hatch to any temperature you want and it maintains that same steady, even heat all the time, until you're ready to change it or shut it off.

Big Hatches! Better Chicks!

Remember, with the Lectro-hatch, there is no smoke or poisonous gas to stunt or kill the chicks in the shell. Fresh, pure air circulates constantly. There are no cold corners, no ups and downs in the temperature. The largest, most successful poultry raisers in the United States will tell you, from experience, that Lectro-hatch day-old chicks usually have the appearance of being a week old. They are bigger, livelier, healthier in every way. And it is not uncommon to hatch 80 to 90 per cent. of the fertile eggs in the Lectro-hatch.

So Easy! Cost Is Low!

We send plain and complete instructions for converting your machine into an electric. You don't have to know a single thing about electricity to install the Lectro-hatch or to run the incubator. Bore a hole and drive a few tacks—that's all there is to installing it.

It makes no difference what make, size or style machine you have, the Lectro-hatch will fit it. It attaches to any electric light socket, and operates from any kind of electric current—from farm lighting plant, traction line or town lighting systems.

The cost of the Lectro-hatch Element is small, and the expense of operating it

figures about the same as for a good grade of oil. And, oh, what a wonderful investment in hatching results, in cleanliness, in ease, convenience, and peace of mind.

Poultry Experts Endorse It

U. R. Fishel, World's Leading White Rock Breeder, says:

"We were the first to use exclusively in our Mammoth Hatchery of 18,000 capacity, the wonder element, ELECTRICITY. Not only does this method of incubation hatch stronger chicks, but it hatches larger ones. They really look like week-old chicks as hatched by the old method of incubation." (Note: Mr. Fishel uses Lectro-hatch.)—U. R. Fishel, Fishelton Farms, Hope, Indiana.

Walter C. Young, A. P. A. Judge, Dayton, Ohio, says:

"Never have I operated a machine that holds such an even temperature all through the hatch, as the Lectro-hatch. And the most pleasing feature of all is the size, weight and vigor of the chicks as they come out. Last year we hatched 75 per cent. of all fertile eggs left in the machine. One hatch in particular we brought out 83 chicks from 85 eggs."—Walter C. Young, Dayton, Ohio.

Lectro-hatch Incubators and Brooders

Besides making electric equipment for converting old incubators, we also make complete new electric incubators and brooders. They are strictly high-grade in every respect, built to last a lifetime, but cost no more than the better grades of old style machines. Incubators: 65-egg, \$25; 150-egg, \$38.50; 300-egg, \$68.75; 600-egg, \$123.50. Brooders: 150-chick, \$16; 500-chick, \$23.50. When ordering, tell us the voltage of your electric current. Order from this, or write for catalog.

Investigate electric hatching. Write today for information and prices on converting your old machine.

PORTLAND, INDIANA

Oat Sprouter \$2⁴⁹

This home made oat sprouter was made in one evening by a fourteen-year-old boy with no tools but saw and hammer. The total cost, including stove for heating, was \$2.49. Thousands of these sprouters have been made at home by poultry keepers and hundreds of letters in my files testify that it is the cheapest to make, the easiest to operate, and the handiest and best sprouter ever built.

To make hens lay abundantly in winter you must feed growing green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

Make Layers Out of Loafers

The Putnam Home-Made Oat Sprouter will supply better and sweeter sprouted oats with less fuss and dirt and work than any other sprouter made. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the stove is \$2. postpaid. Plans for building the Sprouter are packed with every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

You can't afford to be without this oat sprouter, even if you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before spring. Most dealers keep it. If yours does not, send me his name and \$2. and I will send you the stove, postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in ten days and I will refund your \$2. together with the postage for its return. I'll run all the risk.

CURRENT NOTES AND COMMENT

Commission Men

We receive a number of letters every fall asking for the names of reliable commission merchants in different cities who will receive and pay top market prices for good live poultry and eggs. Readers who are interested in securing such addresses should write the National Poultry, Butter and Egg Association, H. F. Jones, Sec'y, 208 North Wells St., Chicago, Illinois, for a list of their members.

Commission men do not like the marketing programs of the co-operative agricultural associations. They have themselves largely to blame. When did commission dealers ever seek contact with poultry producers? Outside of a few receiving houses in eastern cities, the great producing sections of the country are at the feet of the country buyer. He often fails to recognize quality. When the quality producer wants to ship direct to a big market, he finds too often that the commission dealers live in another world. We hope that Mr. Jones sees this item for he is looking for ammunition that will carry home to the minds of his membership the fact that they should strike up a speaking acquaintance with the progressive poultry keepers in their respective sections who are quality producers of chickens and eggs.

* * *

City Grown Chickens

Prof. T. J. Newbill of the National Dairy Council recently stated that of two million baby chicks sold to people in Chicago last season, not one million were alive a month after they were bought. He said that correct feeding methods would have produced 1,800,000 Sunday dinners from those two million chicks. He overlooks the fact that 5 and 10c store and department store methods of handling chicks determine their destiny. The best of feed would not save them. High mortality is unavoidable if once the chicks are thoroughly chilled or overheated.

Sometimes the city man does grow out quite a batch of chickens. Strange to say however, he frequently underfeeds his flock. Another big mistake he frequently makes is to keep too many chickens. Six or eight or ten birds in the average small back lot, that enjoy the room of the entire coop, and receive the full amount of the little feed measure, will usually do better, lay more eggs, and give more satisfaction than an overcrowded, underfed flock of twenty.

* * *

A New Kind of Poultry Association

The only kind of local poultry associations that used to be organized were poultry show associations. Now comes a new kind—local poultry marketing associations. The slogan seems to be: "This is an age of co-operation; why should poultry producers not co-operate in marketing?"

In Logan, Utah, the Cache County Poultry Marketing Association was organized on Oct. 10th. The founders represented ten thousand hens. Article II of their constitution reads:

"The object shall be to secure and improve better strains of poultry; to produce more eggs of good color and size; to handle eggs more carefully, in order to avoid waste; to pack a uniform grade of clean fresh eggs, in order to guarantee them and thus create a reputation; to market same more directly to the people who consume; to purchase supplies in a co-operative way; and to transact such other business as may prove beneficial to its members and to the consumer."

All members must deliver to the association's place of business all eggs they produce, except those needed for home use, and incubation. The eggs must be infertile. Fertile eggs are accepted at a discount subject to candling. They must not be cleaned. Dirties are accepted only at a discount. The eggs must be gathered twice daily and delivered

The BIG GOLDEN Buff ORPINGTONS WYANT BROS. THORNTOWN, IND.

Their full massive form is nicely balanced by their refinement of detail. Their soft mellow coloring of lustrous gold always brings a reaction of pleasure and admiration to the fancier who responds to

CHICAGO COLISEUM QUALITY AT ITS BEST

Splendid Breeders	Males	\$5, \$10, \$15	PENS \$24, \$35, \$50
	Females	\$5, \$7, \$10	
Exhibition Stars	Males	\$25, \$35, \$50	PENS \$75, \$100, \$125
	Females	\$15, \$20, \$30	

Sound business principles recommend investing wisely. To secure the maximum of enjoyment and recreation from pure breeds, one must feel that those from whom he buys are extending the same faithful service and relations of helpfulness that he would like to some day extend to others.

In this respect the BIG GOLDENS are pre-eminent leaders. No firm in America offers equal quality on the same terms. Approval and C. O. D. Shipments. You are satisfied always if they come from

Our Buff Orpingtons

WON AGAINST THE BIGGEST BREEDERS AT SYRACUSE, N. Y., this September, as follows: 1, 3 Cocks, 2 Hens and 2 Old Pen. In October we won at Great Hagerstown Fair: 1, 2, 3, 4 Cocks, 1, 3, 5 Hens, 1, 5 Cockerel, 1 Pullet, 1, 2 Old Pen and 2 Young Pen. There were 81 in competition at Syracuse and 85 Buff Orpingtons at Hagerstown. We not only win at the best Poultry Shows, but we have The World's Official Laying Hen, who holds the World's Record, 343 eggs in 365 days. We will have 8 of her Sons properly mated to 80 Hens, and the Eggs for Hatching will be \$10.00 per 15. Our other matings will be \$5.00 and \$7.50 per 15. All of our matings are based on the Female transmitting her laying powers to her Cockerels and they to their Pullets, so eggs from Lady Egg-A-Day's Cockerels should give you a lot of wonderful laying Pullets. We are booking orders for eggs for hatching, and while we have received orders for next Spring delivery, we expect a rush of business from the present indications. We have some Cockerels and Hens that will help you to win at your Show. We will sell baby chicks after January 1st, 1923.

The New Blue Flame Buckeye Colony Brooders

Another BUCKEYE Achievement

At last, we are able to offer poultry raisers an oil-burning brooder whose results we can guarantee as unqualifiedly as our world-famous coal-burning brooder—acknowledged by hundreds of thousands the unfailing wonder in the preservation and development of chick life, saving millions of chicks per year.

Made in Three Sizes—Operated With a Wick.

Working on the broadest experience in the industry, with all types of burners, both wick and wickless, we have developed a wick-type burner that gives the steady, sustained heat without possibility of going out or overheating.

No Crowding—No Chilling. Due to the colony idea, made famous through the widespread use of Buckeye Brooders, the highest possible percentages of chicks are raised to maturity. No sudden changes, suffocation, chills or infantile chick complaints. Cripples and weaklings are practically unknown.

World's Foremost Breeders Use the Buckeye.

Buckeyes are used in the agricultural colleges of forty-four states and there are hundreds of thousands in use throughout the country—doubtless in your own neighborhood.

Buckeye the World's Foremost Incubators—From 65-Egg to 10,368-Egg Capacity. More than 600,000 Buckeye Incubators are in use throughout the United States. More Buckeyes are shipped to foreign countries than the total foreign shipments of all other American makers. More than eight hundred foremost commercial hatcheries use Buckeye Mammoth Incubators. More than 54,000,000 chicks per year are Buckeye hatched.

Which Catalog Shall We Send? Grow three chicks where one grew before, save half the time and expense. If interested in Blue Flame Brooders send for catalog No. 24; or in coal-burning Brooders, for No. 36; Buckeye Incubator Catalog No. 48 tells how to grow more chicks and better chicks.

EDWIN SPRUNGER,

WOODBURN, INDIANA

before one week old. Members shall deliver eggs only from their own hens. The manager is paid a commission of 10 cents a case; and the secretary of the association, 15 cents a case on eggs sold.

The purpose of the Poultry Marketing Association is to put over a campaign of better poultry, greater egg yield, better marketing arrangement, better buying conditions.

By the very nature of the case, co-operative movements never make big profits that develop into surpluses. They pay out their profits from month to month and year to year to their co-operating members. As a result they will experience the same difficulties as poultry show associations which never have a big capital to draw on, and when they hit upon a loss, they have to go to their members to dig down in their pockets and pull the organization out of the hole.

* * * Broilers

There seems to be a reviving interest in broilers. The following table based on work at the Connecticut Agricultural College shows the age at which White Leghorn chicks should attain the weights indicated and the food consumed per bird since hatching to attain those weights at the specified ages:

Sex	Normal Weight	Food Age Consumed
Cockerels and		
Pullets	1 lb.	8 weeks 3.5 lbs.
Pullets	2 lbs.	14 weeks 9.8 lbs.
Pullets	1-2 lbs.	17 weeks 13.6 lbs.
Pullets	3 lbs.	21 weeks 19.4 lbs.
	* * *	

News Among the Breeders

Upon the death recently of F. S. Peabody, owner of the beautiful country home known as Mayslake Farm, Frank F. Conway purchased from the estate the entire flock of Buff Orpingtons, and he is now owner as well as manager of the Mayslake Buff Orpington flock.

Frank H. Davey recently purchased a 56 acre home near Middletown, New York. He writes that all fall he was busy flying around looking for a suitable place, and that the farm he bought has a very good set of buildings, all improvements, two dwelling houses, and that he has started a new 100-ft. poultry house.

A. J. Gilbert, Columbian Wyandotte breeder, writes that he has removed his flock to a large and better farm at Haverhill, Mass.

John D. Jaquins, poultry judge, Watervliet, N. Y., has been very sick the past summer, but is now much better and plans to buy a farm in the spring and devote his entire time to poultry breeding.

Harry Wolsieffer, poultry editor of the Philadelphia Record, has purchased a farm at South Vineland, New Jersey, and will grow his old favorites, the Buff Wyandotte, together with some S. C. White Leghorns.

* * * The New Standard

Writing under date of Nov. 6th, President Rigg stated: "Work on the 1923 American Standard of Perfection is progressing rapidly."

The American Poultry Association authorized the publication of the new Standard by Jan. 1, 1923, and the Revision Committee did its work with that end in view. The details of publishing the book are in Mr. Rigg's hands. When the new Standard is printed and available for distribution, announcement to that effect will be made in these columns. The present 1915 edition will be in force throughout the present poultry show season.

Press Comments on Drevenstedt for Vice President of American Poultry Association

"J. H. Drevenstedt, poultry editor of the Fancier and Stockkeeper, is out for the vice presidency of the American Poultry Association. Probably no other fancier and judge of fancy poultry is better known than "Drev," as he is dubbed by those who know him and those who do not, nationally and internationally.

"His long years of service as a breeder and judge have endeared him to all of the poultry world, principally for his ability, honesty and strong convictions.

"Drev will undoubtedly make a forceful and active official, and if his election is a stepping

stone to the presidency the fancy will not suffer. Could the association be built up of Dreves, politics barred and the membership become active, then the fancy would receive an impetus that would carry it forward for a great many years to come."—F. V. L. Turner, Philadelphia North American.

"For vice president (Judge) J. H. Drevenstedt has been announced, not by himself, but by his friends and this is one bit of news that adds pleasure to our life. The only question we would ask is, "Why not make him a candidate for president"? There is no truer nor greater lover and fancier than "Drev." His service has been long and loyal and if ever a man deserved well of the poultry fraternity that man is John H. Drevenstedt. Everybody that knows "Drev" also knows that he is able and would fill any office with credit to all concerned."—H. P. Schwab, Everybody's Poultry Magazine.

* * *

Poultry Success Changes Hands

A. D. Hosterman publisher of Poultry Success for the past twenty-two years, has sold his interest in that publication to Campbell L. Cory and Burton deB. Keim. Mr. Cory has been connected with Poultry Success since 1913, first as advertising manager and later as editor, which position he will retain. Mr. Keim has been connected with D. L. Auld Company, an advertising agency located in Columbus, Ohio. The new owners plan to make a better and greater publication, in which work they have all the good wishes of their many friends.

* * *

In the Olden Days

An old fancier writes:

"Felch and I had many a verbal scrap in bygone days, but Uncle Isaac was a square fighter always and a very good friend. I enclose a letter which shows the 'stuff' I. K. Felch was made of."

The letter, written Dec. 8, 1907, reads as follows:

"For forty years I paid my own expenses to attend the A. P. A. meetings. It has been only those who were interested in the A. P. A. that have done so and they have been the best helpers to the old association.

"The A. P. A. is or should be the poultryman's friend and helper and as such they who are active today should, as in its early life, maintain and nourish it. It is meant to help the whole membership, not a few of them.

"When the association comes back to the principles that founded it then there will be less to censure."

"I. K. FELCH,"

* * *

Reduced Fares to Chicago Show

The Chicago Coliseum Show will be held during the week of the International Live Stock Show. The Western Passenger Association announce a reduced railway fare of one and one-third fare for round trip to Chicago in the Association's territory, Missouri River and East. Tickets will be sold Dec. 1 to 5, with final return limit, Dec. 11, 1922.

Finances

To substantiate our statement that the A. P. A. had \$822.10 in the treasury at the close of the Knoxville meeting, we reprint the financial statement of Aug. 31, 1922, as follows:

"Total in Irwin's Bank.....\$9,302.52
"By checks drawn through Treasurer, U. R. Fishel..... 8,480.42

"Balance in Irwin's Bank, Aug. 31 \$822.10"

Irwin's Bank, Columbus, Indiana, is where the treasurer's funds are kept. In addition, there was a balance of \$781.69 in the Standard Reserve Fund, and a balance of \$300 which is maintained each month in the cash fund at Fort Wayne. Bills payable by the Association are never listed in the Secretary's report, so the liabilities never are accurately known by the Finance Committee.

The statement has been made that no money will be borrowed to finance the publication of the new Standard. It may be explained by the fact that the Fort Wayne Box Co. has been

Save the lives of baby chicks

MILLIONS of little chicks can be saved by feeding them steam-cooked chick feed instead of raw and indigestible feeds.

The H-O exclusive steam-cooking process makes the feed wonderfully easy to digest and insures its keeping sweet and palatable. H-O Steam-Cooked Chick Feed "saves the lives of baby chicks," so we call it—

Life-Saver STEAM-COOKED CHICK FEED

It's wholesome! Made only from choicest quality cut-oatmeal, cracked corn, wheat, kafir-corn and peas, all cut to pin-point fineness. No chaff or screenings, therefore no loss or waste in feeding.

It's balanced! Exactly the right combination to provide maximum muscle, bone, feather and energy-producing elements.

It's steam-cooked! By our exclusive steam-cooking process, the grains are made easy to digest by even the weakest chick. It prevents bowel trouble, white diarrhea and kindred ailments.

It's guaranteed! Life-Saver Steam-Cooked Chick Feed is guaranteed never to become sour or musty.

and still is doing thousands of dollars worth of work for the A. P. A. and either has quoted or probably expects to quote a price for the printing and issuing of the new book, and like any other publishing house, can carry the account for three months. As soon as the new Standard is off the press, thousands will be sold, and in a short time the Association will have ample cash on hand to take care of the payments on the new edition.

When President Rigg took office, there was a sum of \$9,606.38 on hand, according to the Secretary's statement. During the past year, the Association transacted a gross business of \$30,062.30, according to the report. That makes a total of about \$40,000 in the hands of the executive office last year.

It would be easy to dwell on unusual expenditures during the year. For instance, there is an item of \$153.63 to pay the expenses of the President to the Boston show, where he was engaged to judge. There is a similar item of \$148.72 to the Madison Square Garden Show, where he judged. Again, President Rigg pays to Judge Rigg \$210 for going to the Trenton and New York State Fairs, and \$136.72 in connection with a trip to the Newark, N. J., show.

* * *

Anconas

The accompanying illustration of Ancona chicks shows a preponderance of black on top while the black of the breast and body is broken with white.

These are chick feathers. The next stage is

Partly Grown Ancona Chicks

for these chicks to shed their crop of plumage and grow their adult feathers.

Not only the larger comb distinguishes the bird on the left as a cockerel, but underneath, his back feathers will be found the narrow saddle feathers that are to ultimately give finish of masculinity to this baby male. Pullets never develop the saddle feathers that are characteristic of the male sex; and the presence of these feathers infallibly determines that a chicken of broiler size will be a cockerel.

As the adult plumage develops, the chickens change in their appearance. The mottling is more evenly distributed in the mature plumage. One defect of the chicks in the picture is the white plumage on their heads. The head should be predominantly black. White heads are an old fault not seen in the best birds today. A little white tipping on the head is sufficient.

The plumage of the mature specimen should be a glossy, greenish black, with nearly every feather ending in a neat, clean cut white tip. The new Standard will call for one feather in two tipped with white, in a number of sections of the bird. To some who are accustomed to the present Standard requirement of one feather in five tipped with white, the new description will be interpreted as lightening up the color a great deal.

The Mottled Ancona is a mottled chicken, not a black chicken, and very dark birds are coming in for criticism. Dark birds were necessary and desirable a few years ago, in order to get sound, dark heads, and wing primaries and secondaries, and tails; and to also get the lustrous green sheen that is not found on washy, gray birds; but now that we have sound heads, wings and tails, and a rich sheen on the plumage of the body, the job today is to hold these desirable points and breed more snappy white tips at the ends of the feathers.

It is the contrast between the glossy, greenish black of the ground color and the pure bright snow fleck at the point of the feather that gives the bird its distinctive and vivid

beauty. If the white tip is so big as to be an old fashioned mottle, or if the black and white run into each other, not cutting off sharply so that each color is contained within itself, then the careful judge must cut the specimen on color.

The small tip is related to the shape of the feather. If the back feather is a short, fat feather, with a blunt, rounded end, the white tip will be broad and big. If the feather is longer and more pear-shaped, tapering in toward the end, then the tip will be finer and neater, and the longer feather will afford more black ground color to show on the surface of the plumage. The result is that the hens with this kind of a feather may have nearly every one of the individual feathers in their backs tipped with white, yet not appear light in color. First, they have more black ground color on the feather; second, it tapers into a smaller, neater tip.

Roy Van Hoesen wrote us that he is about to get out a new edition of his Ancona History, and wanted a "memorial" on Anconas from our pen for inclusion in the new book. He kindly sent us the illustration of partly grown Ancona chicks, and so we write the above which he is at liberty to use. If it serves to teach new breeders to study feather character it will teach them a thing that it took older fellows years to learn, and during those years they groped for what seemed to be an elusive thing called "perfection." Today we know that the perfection of feather patterns in varieties is often largely dependent upon the shape and character of the individual feathers. That helps to simplify selection and mating.

A Meat-Poultry Show

Five hundred fowls were exhibited from ten states at the first Meat Poultry Show, Harrisonburg, Virginia, Nov. 4 to 6. The first prize pen consisting of a cockerel and four pullets, hatched since Jan. 1, weighed 43 lbs., 4 oz. The cockerel at the head of this pen weighed 10 lbs., 3 oz. The pen was comprised of Light Brahmas, bred and grown by that old Brahma breeder of Illinois, by the familiar name of John Chantry. According to the rules, the pen became the property of the Chesapeake and Western Railway and Mr. Chantry received the first prize money of \$500.

Second prize of \$250 was paid to J. F. Denett, Virginia on a pen of Black Giants. This pen weighed 42 lbs., 8 oz.; the cockerel alone, 10 lbs., 8 oz.

Third prize pen, \$150, White Orpingtons, exhibited by E. R. Ottinger, North Carolina. A Black Giant capon weighed 14 lbs.

Nine Thousand Birds at Toronto

The Royal Winter Fair, the first to be held at Toronto, Ontario, Canada has a poultry entry of 9,100 head. The Winter Fair, generally recognized as the largest poultry show on the North American continent, has been

Beginning this year the great show is staged in the new million dollar arena at Toronto.

J. S. Greenshields, Toronto, writes: "For our Royal Fair, Nov. 22-29th the entries in the poultry section run over 9,100 birds. In Plymouth Rocks entries are close to 600, Wyandottes over 500, White Leghorns alone over 350, Ornamental bantams 400, with turkeys and waterfowl 450. Other breeds well represented with a wonderful entry in Red Caps, Polish and Minorcas."

* * *

Slipped and Twisted Wings

A bad fold of the wing is not only an unsightly defect but it is a persistent hereditary fault, which, once bred, transmits itself with discomforting regularity. The American Poultry Association recognized this fault and made a new cut for a slipped wing, while a wing so badly twisted that the primaries fold on the outside of the secondaries is made a disqualification in the new Standard.

When there is a split between the primaries and secondaries the bird should be cut for defective wing shape. Loose wings of this kind denote weakness. The wing should be well enough muscled to have a spring to it when it folds, and it should fold up in an

A MONEY MAKER FOR POULTRYMEN

The "EVERGREEN" Oat Sprouter

—the sprouter that's different

Cuts Your Feed Costs

Satisfied Users Everywhere

B. J. Baskerville
Joliet, Ill.
Am writing to tell you how much I like my "Evergreen" Oat Sprouter. I find that the "Evergreen" is a good investment for poultrymen. It will grow a continuous supply of green food. It will grow from three to four inches in a week (the time allowed each pan by feeding one a day). It requires but very little attention. I am safe in saying that you manufacture the best oats sprouter on the market.

Yours very truly, (Signed) FREEMAN HOFFMAN
Route 1, Columbia City, Indiana

At Last!
The Perfect
Oat Sprouter

After many years experimenting to produce an oat sprouter that would produce the greatest amount of tender green oat sprouts in the shortest time with less trouble and without any waste or spoilage, we have at last succeeded. This new improved EVERGREEN OAT SPROUTER is in a class by itself. Whether you are a "back-lotter" with only a few birds or if you are raising poultry on a large scale you need an EVERGREEN OAT SPROUTER—it spells SUCCESS to every poultry raiser—it cuts down feed costs—it

Converts One Bu. Oats Into More Than 3 Bu. Green Feed

The secret of the success of the EVERGREEN is in its two heat chambers—its interior arrangement—its heating system and its convenience. We discovered that different degrees of heat were necessary during varying stages of germination and growth of oat sprouts to get best results—the EVERGREEN supplies the different temperatures during the various stages—that's why it produces more green feed with less grain and spoilage.

EVERGREEN machines supply you with a never ending supply of an abundance of tender green sprouts, enough for your flock of hens every day. Each day put in a tray of raw oats, at top of machine and take out tray of tender sprouts at bottom—it's a revelation.

FREE Catalog Write today for descriptive catalog folder and price list, telling all about this wonderful machine—how it will enable you to double and treble your poultry profits. Don't buy an oat sprouter of any description until you find out about the better, more convenient EVERGREEN.

Mfg'd by B. J. BASKERVILLE, 301 Hunter Ave., Dept. A. P. J., Joliet, Ill.

At Chicago and Boston Shows Carefully Inspect the

Mackay

Multi-Cabinet Incubator

And Meet Jack MacKay Personally

A MacKay Multi-Cabinet Incubator will be on exhibition at the Chicago (Coliseum) Show, December 5th to 10th, and the Boston Show, January 1st to 5th. Mr. Jack MacKay will be there to demonstrate the many exclusive, practical features that make this machine radically superior to other types of mammoth incubators.

It will pay every progressive poultryman to see this real incubator. Get posted on the latest development in the incubator field, whether contemplating additional capacity this season or next.

Our big Illustrated catalog is mailed free. Write for copy now.

Better than Whitewash

CARBOLA

The Disinfecting White Paint

It takes less than five minutes to mix the Carbola powder with water and have it ready to use as a white paint and powerful disinfectant. No waiting or straining; no clogging of sprayer. Does not spoil. Does not peel or flake. Disinfectant is right in the paint powder—one operation instead of two. Gives better results and costs less. Used for years by leading poultry farms.

Your hardware, paint, seed or drug dealer has Carbola, or can get it. If not, order direct.

Wipe Out Every Rat and Mouse

Amazing Discovery Quickly Kills Them All—Not a Poison

Rats, Mice, Gophers,—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. The original, time-tested Danyz, fluid true Virus. Entirely harmless to humans, poultry, stocks, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside, hunting air and water. Imperial Virus is put up in sealed bottles, guaranteed to retain full strength and potency. Only safe and sanitary method to overcome these pests. Indorsed by more than 60,000 users, including Farm Bureau Experts, numerous factories and large, nationally known institutions.

YOU CAN GET YOURS FREE

Send no money—just your name and address, to Imperial Laboratories, Dept. 1042, Kansas City, Mo., and they will send you by return mail two regular full-sized \$1.00 bottles of Imperial Virus (double strength). Pay the postman only \$1.00 and a few cents postage when the package containing the two bottles arrives. Use one to rid your place of the pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

Note—Readers risk no money in accepting the above offer, as Imperial Laboratories are fully responsible, and on your request will refund your \$1.00 any time within 30 days, if you are not entirely satisfied with the results.

orderly manner. Frequently loose or slipped wings have narrow flight feathers. When the wing is twisted the last joint of the wing is usually curled up, that is, the last joint of the wing bone is deformed.

A split or divided tail is not desirable, and the new Standard will call for moderately broad, overlapping feathers in both wings and tails in a majority of all the breeds in order to help get away from any tendency to faulty construction in these two important sections.

* * *

Poor Results from Hatches

E. L. Galloway, Illinois writes: "I have had some complaints about eggs not hatching, but before they got through the purchasers have usually admitted shaking the eggs. It seems to be a common practice to shake eggs at pipping time to determine if there is water or a chick in them. For the breeder who aims to give good value for the money he receives, it is pretty hard to have eggs spoiled by people whose ambitions lead them to anticipate and find out if possible what is within the shell. Whether the order was for 15 or 100 eggs, it is a loss to the breeder. Of course, if a breeder is only interested in replacing all orders at half price, and making as many resales as possible late in the season at half price, that is another matter, for the more eggs spoiled the better.

* * *

Credit to the Other Fellow

W. D. James, prop. of James Buff Leghorn Farm, Wisconsin, issued a mating list last spring in which he described his breeding pen No. 2 as follows:

"This mating is headed by 'James Too Good.' This cockerel hardly needs an introduction. He was hatched from eggs that were bought of Edward P. Boyd, that famous Leghorn breeder, and we wish to give him due credit."

Here is a case of a breeder telling of his purchase of eggs from another breeder, and giving CREDIT to that other breeder. There is too little of this in the poultry business.

Mr. James is a broad-visioned business man who is familiar with the courtesies indulged in by pure bred cattle breeders.

We thank him for the notable example he sets in the poultry world. If followed, it will lead to greater civility and respect in the fraternity, and those who follow such a method will be immediately lifted out of the boisterous, self-praise class by the discriminating buyers of stock or eggs.

How to get **15** Eggs to the dozen

TESTS prove things, that's what they are made for. Exhaustive tests supply the strongest possible proof.

In the Globe Experimental Poultry Plant, and in thousands of private poultry yards all over the country, *Dickinson's Globe Egg Mash* has gone thru the most thorough and most exhaustive tests that could be made.

These severe tests proved, beyond a shadow of a doubt, that: *Any hen conforming to egg producing requirements, when fed Dickinson's Globe Egg Mash, in accordance with Dickinson's Feeding Plan will absolutely lay 1/4 more eggs than when fed only a hard grain mixture.*

This Means 15 Eggs to the Dozen Instead of 12

Dickinson's Globe Egg Mash furnishes the proteins necessary for high egg production—combined with *Dickinson's Globe Scratch Feed*, which furnishes bodily heat and the exercise necessary to maintain health, you get a perfectly balanced ration.

Dickinson's Globe Egg Mash

The Sure Egg Producer—The Standard for 20 Years

Dickinson's Globe Egg Mash is not a drastic tonic that forces the delicate egg machine to an excessive strain;—which "knocks out" the egg producing organs in a short period—*Dickinson's Globe Egg Mash* is a healthful, carefully proportioned protein poultry feed, easily digested and assimilated, that nourishes the hen properly for greater egg production as long as she lives—for her full natural life.

Not only will *Dickinson's Globe Egg Mash* produce more eggs but they are better eggs to eat; firm, sweet and palatable, and besides, the eggs will hatch stronger, sturdier chicks. *Dickinson's Globe Egg Mash* should be in hoppers before your flock all the time—every day in the year.

Then use *Globe Scratch Feed* night and morning in the litter to induce exercise—a hen must have both—*Dickinson's Globe Scratch Feed* to sustain her and *Dickinson's Globe Egg Mash* to make her "shell out" more, and more eggs.

Our special folder on *Globe Egg Mash* will give you the *Globe System of Care and Feeding*. Write today for this *free folder*—it will show you how to get *Greater Egg Production and Greater Egg Profits*.

Use the Coupon and Do It NOW! Insist on Globe Poultry Feeds.

Poultry Association, which was organized in Buffalo, N. Y., February 15, 1873.

As a part of the Golden Jubilee celebration a banquet of sixty plates will be served at the home of Geo. Urban, Jr., and a special reception will be given to the old members of the A. P. A. one day during the Buffalo show.

J. Y. Bicknell, former President of the A. P. A. and one of its earliest members, is a resident of Buffalo, and will be on hand to shake hands with the new generation of breeders. Mr. Bicknell was one of the greatest breeders and most popular judges of the last century.

It is a splendid thing that Mr. Hewes, as Secretary of the Buffalo show, should arrange this Golden Jubilee, that the breeders of today might pay homage to the last surviving members of that band of forward-looking fanciers who laid the foundation on which rests the magnificent superstructure of today's breeding industry.

In this ill-disciplined age we often take for granted the institutions which were founded long ago by pioneers who planted that we might enjoy the fruits.

Let us not, in our individual pursuits of success, fail to understand the value of a community of interests which center in a strong national organization. The A. P. A. can only be maintained by co-operation, without which all government together with all those modern institutions that make possible our civilization with its advanced state of progress, would break up and return to the primitive, for primitive man alone fails to understand the value of organization.

Mr. Hewes has signally done a fitting thing in making a Golden Jubilee of the Buffalo show this season, that all breeders of poultry who today get more than market prices for their birds, eggs or chicks, may stop to recognize the great and abiding work of the pioneer builders of the pure-bred poultry industry in America.

Big Entry at Coliseum

Theo. Hewes, Secretary of the Chicago Coliseum show, states: "The show, as nearly as I can figure now, is going over last year's entries. The entries are now practically all in but I haven't them all on my books. My secretary and I here, worked last night until after midnight putting the entries on the books, and it appears to me that while we are not going to beat last year's entry a whole lot, we will run two or three hundred birds ahead of last year."

"S. C. White Leghorns are the biggest class. The show as a whole is well balanced with the White Leghorns running wild. It is the National Meet of the Club. There are now entered on the books, 28 cocks, 44 hens, 57 cockerels, 53 pullets, 10 old pens, 14 young pens. The breeders are paying \$3.50 to enter their males for we are giving them a coop 30x30x28 inches."

"In White Wyandottes we have the biggest class at Chicago in years. Arthur Dutton will be here. Columbian and Silver Pencilled, bigger entry than common."

"Light Brahmas are the disappointment of the show. We had money up on this class and it was the Club Meet, too. On Barred Rocks, I have 273 birds on the books with several more entries to list. That ought to be a hearty greeting for our Canadian friend, Geo. Robertson. Some of the breeders have inquired if he would insist on finished birds or would succumb to extra good quality that might not be quite ready. I have replied that from the rather unanimous action of the Standard Revision Committee, on which Mr. Robertson served, I am of the opinion he will insist on a pretty well put down chicken."

"White Rocks are stronger than last year, with several new names on the list and a total of 141 birds. Columbian Rocks bring out a big entry of 88 birds. Blues are entered by their originator—Hasselman. In Silver Pencilled Rocks there are two exhibitors and a nice entry, which indicates an upturn of interest in this fine variety."

"A nice entry of Dark and W. L. Red Cornish. Indeed, we have a better balanced show as a whole. Last year there was not a crested bird in the show, but this year we have both Houdans and Polish. We also have Lakenvelders, Buttercups and even Standard

Games. A nice-bantam entry of about 100 birds. The entry of turkeys is small. In Waterfowls we have a good entry with practically all varieties listed.

"The Rhode Island Red class is big, but have hardly any of the entries transferred to the books yet. C. P. Scott is back. Prospect Farm of New Jersey is showing. No doubt the S. C. Red entry will run heavier than last year. Now, about this processing. If I hear any rumor, any talk at all, I am going to dive right into this thing, have the bird or birds examined and the results published through the poultry press to the interested public. I simply will not tolerate for one minute the darkening of the shade of surface color or deepening the tone of under-color. I don't know whether this so-called processing of Red colors is mere talk or actuality, but on the first rumor there will be a show-down. Surely there are chemists that cannot be hoodwinked nor deceived.

"S. C. Brown Leghorns are away up in numbers—131 birds. S. C. Buffs fall below last year. In Buffs we had the Club Meet a year ago, and a short entry usually follows a big meet. R. C. Whites are in big. In S. C. Whites, Chapman of New Jersey has 2 cockerels, 3 pullets.

"What looks like a nice entry of Black Langshans, but it is not a big entry. A big entry of Orpingtons. Campbell Soup is showing Buffs. Wyant is in, and, I think, Conway. Greenshields and Alden are showing Whites. The class of Blacks is the biggest in years.

"There are an even hundred S. C. Black Minorcas. That is more than common. All other varieties of Minorcas are in and represented.

"There are 84 birds in the utility class. This is probably their last year at the Coliseum, for utility qualities go into the judging of the Standard exhibition classes with the publication of the new Standard."

Final Report of Canadian Egg Laying Contest

The Third Canadian Egg Laying Contest was completed Oct. 30th, 1922, and the records of the birds were closed on the 29th of October.

In order that the houses could be thoroughly cleansed to receive the incoming birds, the curtailing of one day from the last week was necessary.

The removal of the birds from their late quarters permits of no delay, and much credit is due to those helpers on the contest grounds who so handled the birds.

The following list shows the first ten pens in order of merit:

Pen	Owner and Address	Breed	Total
1st.	Lewis N. Clark, Ont.	W. Leg.	2498
2nd.	Culp's Poul. Farm, Ont.	B. Rock	2197
3rd.	A. Hamburger, Mo.	B. Rock	2118
4th.	Experi'm't'l Farm, Ont.	W. Leg.	2060
5th.	H. E. Dennison, Mich.	B. Rock	2016
6th.	F. J. French, Ont.	B. Rock	1992
7th.	W. J. Johnston, Ont.	B. Rock	1987
8th.	Ontario Agri. College, Ont.	B. Rock	1962
9th.	Ontario Agri. College, Ont.	W. Leg.	1925
10th.	G. E. Hall, Ont.	B. Rock	1908

In the individual work Mr. Lewis N. Clark's White Leghorn No. 372 proved herself the final leader, and to her goes the first place. This bird's complete total was 294 eggs, and the fact of her not touching the 300 mark caused considerable disappointment to all concerned.

The next best bird is Barred Rock No. 175, owned by Neff Bros., Simcoe, Ont. Week after week this bird figured in the forefront and as a result successfully secured the second place in the year's work.

The third position is taken by Barred Rock No. 161, the property of Culp's P. Farm, Berkeley, Ont., with a total of 281; only one egg behind the second bird.

Thirteen birds scored 250 eggs or over. Of these, 5 were White Leghorns and 8 were Barred Rocks.

The total number of birds that qualified for the Advanced Record of Performance of 225 eggs during the year was 57 and in addition 333 other birds hold the Record of Performance qualification of 150 eggs.

What Shall We Do With Our Eggs?

Eggs are piled higher in cold storage this year than ever before, yet prices are higher.

In some places eggs are selling at \$1.15 a dozen. How much do you get?

Why aren't eggs moved? P. S. LOVEJOY is showing in THE COUNTRY GENTLEMAN just how the strings are pulled to bring about this annual farce and what can be done about it.

Also, what is the remedy for the increasing production of poultry and eggs—and an inadequate market? E. V. WILCOX has a searching article showing how consumption can be stimulated.

In the next 13 issues THE COUNTRY GENTLEMAN is printing a series of articles (including the above) that will help you make more profit.

Here is important information that you need. Poultry experts like JAMES DRYDEN, HARRY R. LEWIS and RALSTON R. HANNAS are contributing regularly.

Is Your Sheriff a Bootlegger?

Or is he merely winking at the violations of the prohibition law?

Investigation shows that 90 per cent of the farmers are "dry."

Liquor interferes with the successful operation of their farms.

What are you going to do about the open violation of this law you helped to pass?

How are you going to fight the gang which is trying to repeal it?

THE COUNTRY GENTLEMAN is running a remarkable series of articles on prohibition, showing just how the slipshod handling of this rum question is affecting your pocket-book. These appear in the next thirteen issues.

STRIKES!—

the Farmer Always Gets Stung

You bet the farmer always gets stung—no matter who wins.

But just how?

Have you figured out all the ways by which you get the short end of it whenever the railroad men or the miners or anybody else goes on a "vacation"?

EDWARD HUNGERFORD has.

He tells in vigorous fashion just how, and suggests a remedy.

This also comes in the next thirteen issues.

13 ISSUES FOR ONLY 25 CENTS

For only 25 cents, we will send you the next 13 issues of THE COUNTRY GENTLEMAN, containing these and many other important features.

THE COUNTRY GENTLEMAN emphasizes the *business* end of farming.

Forty pages, each week, packed with meaty, sound *help*.

Mail this coupon with 25 cents—coin, check, money order or stamps—we take the risk.

Your first issue, mailed promptly, will be worth to you more than the whole amount. *Only a quarter.* Mail it now while you are thinking about it.

25¢

it's time now to order your*

NEWTOWN Colony Brooders

If you've asked leading poultrymen who use them, you know that the time-tried-and-proven NEWTOWN Coal-burning Colony Brooder, "raises the most chicks, the best chicks, with least labor and at lowest cost."

If you've already used NEWTOWNS, you know from experience.

Get your order in promptly for next season's use and have your brooders on hand in ample time for the arriving youngsters. Don't risk delay.

Remember always, that, just as NEWTOWN Giant Incubators *hatch* the best chicks, so NEWTOWN Colony Brooders *raise* them. Write today for booklet and prices.

NEWTOWN GIANT INCUBATOR CORPORATION
21 Warsaw Street Harrisonburg, Virginia

When you buy Baby Chicks, be sure of their vigor—see that they're hatched in the NEWTOWN. Careful, discerning hatcheries everywhere rely on NEWTOWNS.

WINNERS IN STORRS EGG CONTEST

Hollywood Farm's pen of White Leghorns won the eleventh annual egg laying contest conducted by the Connecticut Agricultural College at Storrs, which ended Oct. 31st, 1922, and covered the year beginning Nov. 1st, 1921. The final score of the pennant pen was 2,218 eggs or an average of more than 221 eggs for each pullet in the pen. Unlike the winners in some contests this pen lagged behind for a large part of the year, but steady laying in the Fall months and a strong spurt during the last three weeks put this pen under the wire a winner by fifty-one eggs. Hollywood Farm finished in second place a year ago and in fourth place two years ago. During the last three years, their three pens, consisting of thirty birds, have laid 6,555 eggs, or an average of 218 eggs per hen, an enviable record for consistently good laying. Leghorns have not won the contest since back in 1914 when Francis F. Lincoln, Connecticut, sent in ten pullets that proved the best layers in the country. The following list shows the winning breeds at Storrs during the last ten years:

Year	Breed	Score
1913	White Leghorns (only 5 birds)....	1190
1914	White Leghorns	2088
1915	White Wyandottes	2072
1916	White Wyandottes	2265
1917	Barred Rocks	2119
1918	Oregons	2352
1919	Barred Rocks	2022
1920	Barred Rocks	2234
1921	White Wyandottes	2234
1922	White Leghorns	2218

The best Connecticut pen was entered by Woodbridge Orchards. In the Plymouth Rock class Harry G. Culver's birds from Long Island finished the year eighty-one eggs ahead of any other pen in their class. In the Rhode Island Red group a pen entered by The Orchards, Massachusetts, was an easy first with a score of more than 1900 eggs. In the Wyandotte class Frank P. Matteson's pen from Rhode Island was more than 100 eggs ahead at the close of the contest. There was a total of 1000 hens entered in the contest. They came from fourteen states, England and one province in Canada. They laid a grand total of 162,880 eggs, the second highest annual lay in eleven years. The following table shows the number of birds in each of the principal classes, the average individual egg yield for the year, and the general average for all varieties that took part in the contest.

100	White Wyandottes	168.4
400	White Leghorns	165.7
260	Plymouth Rocks	162.0
240	Rhode Island Reds	156.8

1000 Average all breeds..... 162.9

Barred Rock Hen No. 28, owned by the Agricultural College at Guelph, Ontario, was the outstanding individual in the contest. Her production of 301 eggs in the 52 weeks makes her the second best hen ever trap-nested at Storrs and during the last ten years over 10,000 hens from Canada, England and thirty different states have tried to reach this pinnacle of hen fame. The two second best hens in the contest were White Wyandotte No. 264 from England, and White Leghorn No. 672 in the Hollywood pen. These two birds laid 277 eggs each. In the Rhode Island Red class hen No. 599 from Massachusetts, was at the top with 250 eggs. The best Connecticut hen was White Wyandotte No. 328 with a record of 265 eggs.

Pen	Breed and Owner	Eggs
168	Hollywood Farm, White Leghorns..	2218
130	Frank P. Matteson, Wh. Wyandotte..	2167
106	Harry G. Culver, Barred Rocks.....	2124
102	W. H. B. Kent, Barred Rocks.....	2043
133	Woodbridge Orchards, Wh. Wyan..	2037
103	Ontario Agr. College, Barred Rocks	1983
127	Walter Bradbury, Wh. Wyandottes.	2008
116	H. E. Dennison, Barred Rocks.....	1959
200	George B. Ferris, White Leghorns.	1955
151	The Orchards, Rhode Island Reds..	1946
192	Rapp's Leghorn Farm, Wh. Leg....	1937
182	Andrew D. Ohr, White Leghorns....	1937
164	Goshen Poultry Club, Wh. Leghorns	1933
111	Mich. Poultry Farm, Barred Rocks..	1927
171	Beck Egg Farm, White Leghorns..	1903
110	Merritt M. Clark, Barred Rocks....	1879
189	Meadowedge Farm, Wh. Leghorns..	1869
162	Small's Poultry Farm, Wh. Leg....	1851
150	Charles D. Pierce, R. I. Reds....	1849
101	Purdue University, Barred Rocks..	1836

Give green food daily. This helps, among other things, to keep worms—a very troublesome complaint—at bay. If your fowls have this complaint, then give a teaspoonful of powdered areca nut in the soft food of every ten birds every third morning until five or six doses have been given.

The days on which areca nut is not given, give one teaspoonful of liquorice, pepsin and bismuth in a cup of milk. Mix this with the soft food for one meal per day. The other feeds should be as usual.—Will Hooley, Poultry World, England.

Keep Your Egg Factory Going Now At Spring Production, Feed Sprouted Oats and Watch for ASTOUNDING Results

Get the Facts About Our Grain Sprouter. Learn What It Has Done for Your Brother Poultry Raisers and What We Guarantee It for You

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1923 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" Grain Sprouter

**Practically All Steel—
Made in Sections
New Safety Lamp Insures Doubly
Against Accident**

Double steel walls—metal trays. There is nothing else like the "Successful" Sprouter. It's a brand new idea. Cannot be compared to wooden sprouters. It is warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold.

20 lbs. raw (3 pecks) oats as shown above makes 70 lbs. of sprouted oats as shown below in the "Successful" Sprouter

This in one week's time—the best green egg-making feed obtainable.

SPROUTED OATS

The "SUCCESSFUL" Fireless Non-Freezing Sanitary Drinking Fountain

Keeps water warm in winter and cool in summer. Made on the famous thermos bottle principles. No lamps to fuss with. Clean pure water at all times. Saves a lot of labor. Made of galvanized steel. Holds two and a half gallons. Solves for all times your winter watering troubles. Price \$4.00.

Read These Letters From Owners

Enjoys a 60% Egg Yield

Big Run, Pa., Jan. 20, 1922. Gentlemen: Have had splendid success with your Sprouter, Incubator and Brooder secured last season. Very few people secure eggs this winter, but I have been getting about 60% from my flock. I know this is due to feeding correctly sprouted oats. I think the sprouter is just wonderful.

Mrs. Jno. L. Kelly,
Box A25.

80 Hens Averaged Nearly 25 Eggs Per Hen for a Month

Salem, Ore., Apr. 5, 1922. Dear Sirs: Your sprouter is the thing. Would not be without one since I have seen how sprouted oats increases and keeps up the egg yield. One flock of 80 hens averaged nearly 25 eggs per hen for the month of March. Many are getting interested in it.

Harold F. Phillippe
2199 Fairgrounds Road.

Made with glass doors. Each section a separate compartment. Start with just enough sections for your needs and add more as you need them.

Here is a money maker that proves its worth right at the start. It has increased egg yields 100 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day is all that's needed to increase the egg yield. And at the same time you cut your feed cost one-third and settle your green feed problem once and for all. Write for full details.

Write Your Name in the Coupon or on a Postal and Mail Today for Circular and 1923 Offer

We could show you scores of more letters like these, but why not show you the "Successful" Sprouter itself and let you see how it can save money and make money for you every day you use it. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cents.

HOMESTEAD VIGOROUS SILVER CAMPINES STRAIN

The ever-increasing demand indicates the growing popularity of this valuable and wonderful breed, THE SILVER CAMPINES. BELGIUM'S noted fowl for egg laying and beauty. Homestead DOMINATES in the world of Campines—Our Records prove this—Our youngsters are wonderful, all in fine form of beauty and vigor. Our hens are just finishing their moult. Now is the time to reserve or secure your future needs. Don't wait until we have "no birds to spare."

At Madison Square Garden, 1922

Homestead Campines made practically a clean sweep, winning 1-2-3 cock; 1-2-3 hen; 1-2-3-4 cockerel; 1-2-4-5 pullet; 1 young pen. This win, added to their big win at Boston and New York state fair, prove that they dominate in the world of Campines.

They win for all our customers, the blues at home and in foreign lands. Our prices are very reasonable for such quality of egg production and beauty and VIGOR. For head points, type and color and VIGOR, our youngsters of this year's hatch are WONDERFUL.

HOMESTEAD CAMPINE FARMS

Box A, Wayland, Mass.

OKTUSHA WHITE WYANDOTTES

(Regal-Dorcas Foundation)

Our Foundation stock had nearly twenty years of constructive breeding by a "Master Breeder" behind them;

The results from our particular methods of Mating from year to year, prove our ability to make this valuable blood "carry on," as is evidenced by our winnings wherever we have exhibited.

At the recent Indiana State Fair we had thirteen entries and won thirteen prizes, including ALL the Firsts.

No other Strain of Modern Wyandottes has such a combination of Vigor, Egg production and Exhibition Quality.

We offer a fine selection of Cockerels, Pullets and a limited number of Yearling Hens. Write us and describe your requirements.

Cockerel Consignment of Bradford County

There were approximately two hundred and fifty people at this event, composed mostly of poultrymen from Bradford County, Penna. However, a number of buyers were present from other sections of the State and several sealed bids were placed by the Bradford County Farm Bureau.

An Educational Program preceded the sale. Mr. D. K. Sloan, County Agent, presided and explained that the purpose of the sale was to distribute good breeding cockerels throughout this and other counties as well as to encourage the better breeding of Poultry in this section.

Professor H. D. Munroe spoke on "The Value of the Male Bird on the Poultry Farm." He said "Too little attention has been given the male bird in the past, in view of the fact that he represents half of the flock." Many poultrymen kill the early hatched cockerels and ship them as broilers. However, the larger, better developed and more mature cockerels should be saved for breeding purposes the following spring.

Professor H. C. Knandel, head of the Department of Poultry Husbandry at the Pennsylvania State College, gave a very interesting and instructive talk on "His Trip to the Pacific Coast this summer." The keynote of his speech was to practice better breeding methods in the farm flock and aim for a higher quality instead of a greater quantity. He emphasized the importance of trapping, at least the part of the flock which is to be used for breeding, because one must increase the profit of the flock and the best way to accomplish this is by getting a greater egg yield from each individual.

Professor D. M. Gray explained the "Basis of Selection" on which the cockerels were chosen. He showed by figures how the egg yield per hen had increased within these flocks during the last two years, due primarily to more rigid culling during the summer and fall months, both of the hens and the male birds.

The cockerels which were sold at the sale were direct descendants of birds that a Poultry Specialist from State College banded last year. The hens are banded at the end of their pullet year. The banding work in this State is similar to certification work carried on by several other States at the present time.

The cockerels were all banded a short time previous to the sale and are eligible to mate with hens passed for the Advanced Breeding project which is in operation at the present time throughout Pennsylvania. They were selected, especially, for vigor, strong constitution, good body type and size along with other qualities which go to make up a good male bird. Quite a large percentage of the cockerels were sons of pedigreed male birds. However, this had little effect on the sale price. The old saying "Seeing is Buying" is quite true. The larger, better developed, more mature cockerels brought the highest price regardless of the pedigreed male bird which headed the flock. Perhaps this was partly due to the fact that all of them came from flocks which had been especially selected last fall and the breeding pens comprising only the best "Standard Egg Laying Hens" in the flock.

The ten cockerels, entered by each consignor, were displayed in wire cages 7'x3'x3'. These cages were placed directly on the ground. This gave the buyers an excellent opportunity to inspect the birds they wanted to buy before the sale began. One big advantage of displaying the birds in this manner is that it gives one a good chance to compare the backs of the entire consignment at one time, as well as the type and condition of the individuals. The cages were built directly in a row, each one adjoining the other which offered ample opportunity to compare the cockerels of one consignor with those of another. The individual birds were all identified by a Bradford County sealed leg band and had a number which enabled the buyers to identify the birds they wanted to purchase at the ring.

The birds were sold in the Livestock Sale Pavilion which was erected exclusively for events of this nature. It has a seating capacity of approximately one thousand people.

The cockerels were sold on a platform, lo-

cated in the center of the arena 4'x3'x3'. They could easily be seen from any angle of the arena. The buyers expressed their opinion that it was an ideal way of displaying the specimens for sale. Five cockerels from one consignment were placed on sale at one time. Auction bidding was the means of purchasing same. The highest bidder had his choice of the lot. That is, he could purchase the five or he could have the choice of one, two, three or four, whichever he desired. If he only bought part of the lot at one time, they were removed and the remainder were sold until they had all been disposed of.

The bidding was rather slow at first, in fact, the first lot brought a nominal sum. This was due primarily to the newness and oddness of the event. However, after a few of the cockerels had been sold the bidding was much higher and there was no trouble to dispose of the stock. The highest price paid for an individual cockerel was \$16.25. This bird was one of the last five placed at the sale. He was well developed, matured and had a good type and was almost snow white. However, many other birds just as good as he, were disposed of at the early part of the sale for a considerable lower price. There is no question but what birds of equal quality will sell for a higher premium another year because the people begin to realize the value of good male birds to head their breeding flock and know that only the best individuals from the flocks of the most consistent breeders in Bradford County will be disposed of at these sales which will be an Annual Event for the Poultrymen of this county.

A number of sealed bids were mailed to the Farm Bureau. These bids were placed at the day of the sale by the Assistant County Agent and shipped direct to the buyers. These people were well pleased with the cockerels they received and feel that they received a good bargain for their money.

Berries and Poultry

Everyone who makes poultry raising a business finds a quieter season during the Summer months, with some spare time that could well be turned into profit. The nature of his business will not allow the poultryman the necessary time to raise regular farm crops. What he must have is something that can be easily grown with little time spent and at the same time return a good profit. The small fruit family fills these requirements in every way.

Let the poultryman make a careful selection of the best strawberry, raspberry and blackberry varieties, and he is assured of a continuous crop of fine, readily salable fruit, from the first strawberries in the early Spring until the last blackberries in the late Summer. The poultry raiser living in or near a town can quickly build up a market for high quality berries among neighboring families and the grocers in town. If such a market is out of reach by truck, these fruits will stand eight to twelve hour shipments by rail and will come on the market in fine condition.

Only a small space is needed to set out several hundred plants. This is another reason why small fruits are particularly adapted to fit into the poultry man's scheme of business in a profitable way. He rarely has a great amount of land to put into any crop, nor the time to prepare it. A greater profit per acre is made in growing small fruits than any other crop. Good crops of berries can be grown on any fertile well-drained soil, but big paying yields are produced on lighter, sandier soils, such as make the best poultry lands. With the good supply of rich fertilizer available to every poultryman at no cost, extra yields are assured.

Small fruits are easily grown. Soil preparation is the same as for any farm crop, and no more time and care is necessary than to successfully produce a good yield of any cultivated crop.

In addition to the values of the berries from a commercial viewpoint, the poultryman with a field of small fruits also has the convenience and economy of a plentiful supply of delicious fresh fruit all Summer, with enough put away for family use during the Winter.—O. A. D. Baldwin.

All Over the World

Are Helping Poultry Raisers to make more Profit from Poultry

IT has only been a few years since Ful-O-Pep Poultry Feeds were first offered to poultry raisers, yet because of the wonderful results obtained by their use their reputation has become worldwide.

Not only in the United States, but also in Canada, Cuba, South America, England, Denmark, Holland, Switzerland—all parts of the world where poultry are raised Ful-O-Pep Feeds are known and their use rapidly increasing as users pass the message of Ful-O-Pep superiority on to their poultry raising neighbors.

What Ful-O-Pep Feeds are doing for successful poultrymen throughout the world, they will also do for YOU.

The Quaker Oaks Company

Poultry Service Dept.

Address: Chicago, U. S. A.

All

Over

Quaker Oats Company,

I have been feeding Ful-O-Pep Feeds for nearly a year and have raised about 200 High Class Exhibition Cornish. Have fed them nothing else but your feed and have followed your instructions. I have had the least trouble and no deaths from any cause and can only trace it to your feed and method of raising chicks. Yours truly, (Signed) C. J. Wright,

Provincial Vice-President American Cornish Club
Sherbrooke, Que.

October 3, 1922

To Whom It May Concern:

The Department of Poultry Husbandry at the New York State School of Agriculture, St Lawrence University, Canton, New York, has in the past used the Ful-O-Pep growing feeds.

The splendid results the above department has obtained in growing young stock on their demonstration and experimental plant have to be ascribed, to a very large extent, to the Ful-O-Pep feeds, which produced an extremely rapid, continuous and uniform growth and early maturity.

Carl H. Schroeder.

In Charge: Dept. of Poultry Husbandry.

301 North St., Dalton, Mass., July, 11, 1922

The Quaker Oats Company, Boston, Mass.

Gentlemen—For the nine months ending June 30, 1922, my gross returns from 38 Rhode Island Red Pullets amounted to \$265.42—expenses were \$80.85, having a net profit of \$184.58, \$4.86 per hen.

I have 38 hens and one-hundred and four chicks left. These birds were reared on Ful-O-Pep Growing Mash and Ful-O-Pep Laying Mash and Scratch Feed the Ful-O-Pep Way. They began to lay at five and a half months on October 2nd, 1921.

Respectfully yours,

(Signed) Mrs. David Potter.

FUL-O-PEP

POULTRY FEEDS

—the World's Best

It makes no difference where you live—it makes no difference whether you are operating a big commercial poultry farm or only keeping a few birds in your back lot—it makes no difference how successful you have been—if you are raising poultry and have not adopted The Ful-O-Pep Way you have not secured the results that are possible to get from your flock.

Records of Our Customers Prove Our Claims

Ful-O-Pep Feeds produce such extraordinary results because they are extraordinary feeds. The whole resources of our organization—our poultry experts—our research laboratories—our unexcelled facilities for procuring raw materials and converting them into feeds, are the reasons why Ful-O-Pep feeds excel. Exhaustive and extensive experiments and tests to determine exactly the kind of materials required for fowls of all ages have removed all "guess work" from Ful-O-Pep formulas. We have learned what materials are best adapted to the bodily requirements of poultry—these are all combined, properly proportioned and the result is Ful-O-Pep Poultry Feeds—the feeds that because of the results they produce are recognized among leading poultry raisers as "The World's Best."

The Quaker Oats Company

Poultry Service Dept.

Address: Chicago, U. S. A.

FUL-O-PEP

The World

Oisterwyk, Holland

The Quaker Oats Co., Rotterdam

I have had very good results with your Ful-O-Pep Feeds. They have proven to be extra good. My chickens grow very regular and quick and are of high vitality. The results from Ful-O-Pep Dry Mash are very satisfactory. I gladly recommend your Feeds.

Respectfully,

M. Duyts

Lensburg, Switzerland

The Quaker Oats Company

Gentlemen—I have been feeding 12 American White Leghorns Ful-O-Pep Dry Mash since the beginning of March. I have fed 1 Kilogram in the morning and Scratch Grains in the evening. They have laid very diligently, laying 706 eggs up to May 31st.

Besides this I must mention that my ducks liked Ful-O-Pep very much and have eaten it with great pleasure. I recommend Ful-O-Pep Feeds to everybody.

Yours truly,

Hans Hirt.

Quaker Oats Company

Gentlemen—"It gives me great pleasure to inform you of the marked success of Ful-O-Pep Poultry Food in connection with my birds.

I think you will remember that it is only a short while ago that I commenced to use your Food, and in this short while my birds are certainly looking and laying much better than ever they have. From a "Back Yarder's point of view yours is an ideal Poultry Food and I shall most certainly recommend all my friends to use FUL-O-PEP."

Yours truly,

Mr. N. Freedman

446 Edgware Road W 2. London, England

FUL-O-PEP DRY MASH —for Winter Eggs

Before Ful-O-Pep Dry Mash was available for poultry raisers, the idea prevailed that hens could not be made to lay in winter, only occasionally.

We discovered that they would lay in winter as well as in summer if they were provided with the kind of feed that makes eggs. We combined these ingredients in Ful-O-Pep Dry Mash—ingredients as near like the hen picks up in the spring and summer months when on free range as it is possible to produce.

Your Hens Will Lay in Winter

they will shell out eggs nearly the same as in spring and summer if you keep them housed properly and keep Ful-O-Pep Dry Mash before them all the time. Don't make the mistake of trying to get eggs with Scratch Grains; Scratch Grains do not make eggs. Scratch Grains provide only bodily requirements for the hen and should only be fed once a day—just before they go to roost. During the day keep Ful-O-Pep Dry Mash before your hens **all the time** in self feeders. Don't be afraid of over-feeding—your hens can't eat too much. The more Ful-O-Pep Dry Mash consumed—the more eggs. Give Ful-O-Pep Dry Mash a trial and you will get eggs—more than you ever got before. Your dealer can supply you.

Good News for Poultry Raisers

IN announcing our new 1923 edition of the Ful-O-Pep Poultry Calendar, we take a great deal of pride in being able to tell to the poultry raisers of America that this book has been written by Dr. O. B. Kent, one of the best known and most able poultry experts in the country.

"The World's Best" is the expression often heard among poultrymen in speaking of Ful-O-Pep Feeds. We want our Poultry Service Dept. to also be known throughout the length and breadth of the land as "The World's Best." With this end in view we have secured Dr. O. B. Kent of the New York State College of Agriculture, Cornell University, to head this department.

Dr. Kent has spent practically his whole life studying, under the most favorable circumstances, these subjects which are of special interest to poultrymen who are trying to have greater success with poultry, consequently he is well fitted to take charge of our Poultry Service Department.

He was reared on a New York poultry farm, took the complete course of poultry husbandry at Cornell and has spent a number of years as a teacher of poultry husbandry at Cornell; of late has been in charge of breeds and breeding and had general charge of the Cornell poultry experiment farm.

He was editor of Poultry Science, the contributors to whose columns are the prominent poultry husbandry educators of the country. Dr. Kent is widely known among authorities on the subject of poultry and its management, and with him in charge of our staff of poultry experts we know great benefits will result to the many friends of the "Ful-O-Pep" line of poultry feeds.

The "Ful-O-Pep" Poultry Service Department was established to give information and help to poultry men. We want every poultry raiser to feel perfectly free in writing to this department for help or advice on any poultry problem. This department is maintained for YOU — use it — profit by it. Dr. Kent's services cost you nothing. You will find Dr. Kent sympathetic and conversant with your problems, ever ready to give his personal attention to all inquiries addressed to us on poultry matters.

With his experience and expert knowledge of poultry feeding to assist us you may rest assured that any improvements which may be discovered by science or practice will be promptly adopted, keeping the "Ful-O-Pep" line in its present position as the recognized leader in poultry feeds.

Historical Account of the Black Langshan

(Continued from page 1111)

pure birds had previous to this time found their way to our shores and probably also to America. We have received further importations of Langshans from the original Chinese district. Sixteen have been shipped for us, but two came to grief. I never possessed a Langshan that showed any trace of yellow, and I feel sure Mrs. Sargent, who was truly the pioneer of the breed in America, never sent out any such. I have said all I know of the Langshan in my history of the breed. The following extract may be of interest to your readers:

"The fact that some naval officers engaged in an exploring expedition had come across some Langshans elsewhere, and had afterwards met with them at Hangkow, and that another naval officer had brought some from Chusan, where he had seen them in considerable numbers, led us at first to the belief that the breed was widely distributed, and the name a mere localism. But on sending our book to China, our friends there told us in this matter we had been mistaken, that the Langshan was strictly limited to the district of that name and only found in other parts of China by importation. One gentleman with whom we opened a correspondence at that time told us he had been in the Imperial Service of China ever since 1859; that he had traveled thousands of miles in the interior in all directions, and had never come across the Langshan in any other part except by importation. He told us Chinese names usually bore a signification, and that Lang should be translated two and Shan hills. He added that he and other residents in North China, well remembered the introduction of the Langshan to the European community; its date was fixed by the placing of a lightship outside the Langshan crossing in 1862, the officers and crew of the lightship landing to explore and forage, came across this fine breed of fowls, and as occasion offered would send presents of eggs and birds to their friends in Shanghai. Mr. Keele, who is another independent source of information, had in the meantime narrated the circumstance of the lightship and of the Langshan being confined to the district to a lady correspondent in England, these facts were therefore generally known.

"Mr. Keele I have never seen or corresponded with, and the first time I ever heard from the gentleman in the Imperial Service of China was after he had read my book in 1877. I may add he is the only poultry fancier I am acquainted with in China. He came to see me in 1881."

From the above statements it is clear that the origin of the Langshan is not much of a mystery. It came from Northern China, where it had been bred for many years, thrived and "made good." It sustained its Asiatic reputation in England, Australia and America.

The Croad Langshan in England

Under the above caption, Alex Smith, Honorable Secretary of the Croad Langshan Club, contributes a very interesting article to the Feathered World Year Book, in which he states, "The year 1921 has been a red letter one in the Croad Langshan fancy, despite the great loss sustained by the passing of the grand old man, Mr. R. Fletcher Housman. First the Langshan and then the Croad Langshan had to fight for recognition. There was work here for which Mr. Housman was eminently suited. His devotion to the Croad Langshan was whole-hearted and infectious. He said there was no fowl worthy to be compared with it, and you felt that if your birds did not lay six eggs a week you had better look for signs of alien blood. His faith was not misplaced, and he lived to see Miss Simmon's pen win the first place in Section IV of the National Egg-Laying Competition in 1919-20, though not to see her success repeated in 1920-21."

Langshans as layers have won first place in the section for heavy breeds other than White Wyandottes and Rhode Island Reds, which had sections to themselves, at the last two National Egg-Laying Competitions, England. Trap-nested pullets seem to run about an average of 170 to 175 eggs per bird per annum, under favorable conditions, Mr. Smith states, after judging from his own experience

Lord Farms S-C-W Leghorn Cockerels

We have on hand 1000 or more well bred, well grown S-C-W Leghorn Cockerels, all bred from special hens, and sired by cocks and cockerels out of dams with records up to 310 eggs.

Splendid, good sized utility cockerels as low as \$7.50. Other birds from higher record hens and cocks at \$10.00 and \$15.00 each.

Our male birds are all sold on their merits absolutely, you to be the one and only judge as to their value.

Whether you pay \$7.50, \$10.00, \$15.00, or \$50.00 for a Lord Farms bird, if upon arrival you do not think he is worth the money, ship him back at our expense.

We want every bird we ship to be a living advertisement for Lord Farms. Thousands of customers throughout the United States are fast finding out that there is no better strain of Leghorns to breed than the famous Lord Farms Leghorns for day in and day out dependable money-making qualities.

Remember "The male bird is half the flock." Grade up with one or more of these fine males.

Sensational test proves Semi-Solid Buttermilk triples Egg Yield at half the cost per dozen

Stop buying high-priced, ready-mixed chicken feeds, mash, costly animal proteins and so-called "tonics." The sensational, thorough test at Kentucky Experiment Station, conducted by Prof. J. H. Martin, famous poultry expert, proves **Semi-Solid Buttermilk** and corn, oats or wheat (feeds available on every farm) produces 3 times more eggs than flocks fed ordinary farm rations, yet the cost per dozen is only one-half as large.

This remarkable test shows **Semi-Solid** and home-grown grains produce 40% more winter eggs than mash and meat scrap. Even flocks fed milk and high quality mash produce less eggs than birds fed just grain and **Semi-Solid**.

Semi-Solid Buttermilk

(TRADE MARK)

is pure creamery buttermilk, pasteurized and condensed to point of **Maximum Feeding Value** per pound. Fed as we recommend it, it is your cheapest feed. Thousands of farmers use it extensively. Containers range from 1 gallon cans to 500 lb. barrels. 27 factories assure low freight costs and prompt delivery.

Fill out the coupon today and get the full report of Kentucky Experiment Station test and complete information on **Semi-Solid Buttermilk** and how to feed it.

Semi-Solid Buttermilk is a trademarked product; with its purity and quality supreme. Beware of inferior imitations of unknown quality.

and that of Miss Simmons. He adds that he has trap-nested pullets of other strains alongside of his own for the purpose of fresh blood, and found practically no difference as regards the number of eggs they average.

When it is taken into consideration that Langshans lay an egg averaging fully 2 1-8 ounces and that many of them lay eggs of the finest brown color, the Langshan laying 175 eggs should prove a most profitable bird to keep.

According to a competent authority in England, the quality of flesh ranks fourth among all the sixty-odd varieties of fowls, and the superiority of the Langshan in this respect is generally recognized abroad. Other strong points noted by Sec'y Smith are: "The breed was well established in China before its introduction to this country, for which reason they breed very true.

"They are very hardy; chicks need no special attention, and the breed does well in cold, damp and exposed places and on heavy soils.

"Croad Langshans are only of one color and are all single-combed.

"The exhibition standard of the breed is quite in line with utility ideas, and there is no line of demarcation between exhibition and utility birds.

"Double mating is not required; exhibition birds of both sexes are produced from the same mating.

"The breed is steadily coming into its own. It has a long history behind it and is demanding recognition as second to none in its own class—the 'general purpose' fowl. It has fought its way to popularity slowly by its own merits, and this remark is heard in various quarters that the breed is to be the next to 'boom.' If that means that a large number of people are to be led to believe that the Croad Langshan is a perfect fowl, we are honest enough, I hope, to object to anything of the kind. I once asked an old lady who had kept Langshans years ago, and had given them up in favor of another breed, whether she really thought this other—a breed of the same character, but of lighter color—better. She said they were not. The Langshan was the better, but she sold birds for the table. This only served to deepen the mystery, till she, in reply to a question, explained that the deciding factor was not the quality of the flesh, but the fact of their feathers being black and the flesh and skin so white that she had to pluck them far more carefully before she could market them."

The faults are summarized by Mr. Smith when he states Langshans are still too prone to broodiness, they fatten naturally, which must be guarded against if they are not running in the open and being of great size they take somewhat longer to mature than lighter breeds, and when this is said it is all there is to be said against them.

Langshans in America

Black Langshans were admitted to the American Standard of Perfection in 1883, and since that year have enjoyed deserved popularity without undue booming or boosting. Although a little more judicious publicity of their intrinsic value as a general purpose fowl would have served to increase their prestige as well as the numbers bred. The merits and faults outlined by Secretary Smith that are possessed by the Croad Langshans of England are practically the same as with American Standard Langshans.

To the best of our knowledge Black Langshans are at home in all climates, doing equally well in the sunny South as they do in the frosty North. They will respond to reasonable care and feeding wherever put. In other words, the Langshan is a hardy breed, if allowed to be treated as such by man, but not fed and handled in cramped quarters until it becomes a pampered feather liability instead of a vigorous productive asset.

It was as far back as 1896 and 1897 that the classes of Black Langshans were at their peak at the Madison Square Garden Show, New York, when such noted exhibitors and breeders as Dr. F. M. Robinson, Kirby & Smith, Dr. S. T. Lea, George Corson, E. C. Connor, E. P. Shepard, Hempstead Farm, W. T. Levering and Rowland P. Keasby were among the competitors. In 1897, 124 Langshans were exhibited at New York, but in 1920 at the same show the entries were down to 61, due to most of the old time exhibitors

POOR MAN'S INCUBATORS and BROODERS

The Poorman Incubator

Each unit consists of two compartments of 500 egg capacity that can be operated independent of each other. Between each compartment is a mixing chamber wherein the OUTSIDE FRESH AIR is thoroughly heated and moistened to the proper degree of temperature and humidity before entering the egg chambers. A natural circulation (not forced by fans) of FRESH, HEATED, MOIST air is constantly maintained without any mechanical assistance. The ease and security of its operation in producing the 100% chick will be to your financial advantage.

You Write the Guarantee

Do you want to produce and sell 100% chicks? Of course, you do. Your careful investigation of all makes of incubators will have only one result,—it will be a POORMAN, the only incubator where the purchaser writes the terms of the GUARANTEE.

A Poorman Colony Brooder House and Feather Hover

The house is eight feet long and four feet deep, a floor space of 32 square feet. It will accommodate 75 chicks up to three months old.

Eight screws secure the four walls. The roof and floor are removable for cleaning and sunning. One man and an assistant can properly operate 60 units with a total production of 16,875 broilers for the season.

This combination of Colony House and Hover is a complete unit for the production of broilers, and from March 1st to October 15th will produce three sets of broilers—225 marketable broilers weighing two pounds.

Thousands of poultrymen are using my Feather Hovers with the utmost satisfaction, many of whom reported absolute failures with heated hovers. Read their letters in my Catalog.

POOR MAN'S TRAP-NESTED 200 EGG STRAINS

18,000

Customers can vouch for the Superior laying qualities of my White and Barred Rocks, White and Buff Orpingtons, Rose and Single Comb Reds, White Wyandottes and S. C. White Leghorns. I am now offering

A Special Pair Mating of White Plymouth Rocks

Choice Foundation Stock

in yearling males and females from some of my best matings in the above breeds, at very moderate prices, for immediate delivery. This stock is right in its prime for the breeding season of 1923. The quality is no experiment, and with your careful attention you can be reasonably assured of success, as have hundreds of my customers before you.

Eggs and Baby Chicks

I am now booking orders for eggs and chicks, for 1923 delivery, at pre-war prices.

36 Hens Lay 34 Eggs a Day

Zero Weather, Too. Here's How It Is Done. Try It On Your Flock.

"Early in November, I started giving Don Sung to 36 barred rocks which had been laying only 3 or 4 eggs a day. The first month showed a big gain. Yesterday, Jan. 16th, with the temperature five degrees above zero, I got 34 eggs from these same 36 hens. In the first 20 days of January, I got 596 eggs, or an average of about 30 a day. I wouldn't think of keeping chickens without Don Sung."—H. G. Casper, Orrville, Ohio.

Figure this: A \$1 package of Don Sung lasts 36 hens 40 days. Two dozen extra eggs a day, for 40 days, is 80 dozen. At winter prices, figure his profit.

There's no reason why you can't do just as well. Accept our trial offer, as Mr. Casper did. Here it is: Give Don Sung to 15 hens. Then watch results for 30 days. If it doesn't show you a big increase in eggs, if it doesn't pay for itself and pay you a good profit besides, tell us and your money will be promptly refunded.

Don Sung (Chinese for egg laying) acts directly on the egg-laying organs, and is beneficial in every way. It makes hens healthy and happy. They scratch and sing. Pullets develop earlier. The whole flock lays regularly in any season, in any weather, when eggs are scarce and high.

Can you afford to ignore the wonderful reports you are hearing from Don Sung users everywhere? Why not let us show you the same results, with your own flock? Don Sung is no trouble to use. It costs nothing to try. All we ask is a chance to prove our claims, entirely at our risk. Get Don Sung from your local dealer, or send 50 cents for package by mail prepaid (large size, \$1, holds three times as much). Burrell-Dugger Co., 407 Columbia Bldg., Indianapolis, Ind.

being no longer active in the poultry fancy. But in 1922 Black Langshans came back strong at the Madison Square Garden with 103 specimens penned.

It fell to our lot to judge the classes at the New York Garden show last winter and, frankly speaking, we believe the quality found in the winning single and exhibition pens fully equal to what we found in the exhibits when Black Langshans were in the heyday of their glory.

The fact is, Black Langshans have been in good hands always. The fanciers who breed and exhibit them cannot help being good to a fowl that is in itself such a good prospect. Even a careless and indifferent chicken fancier cannot help stopping in front of a cage to admire a majestic looking Langshan cock or cockerel. That bird is a striking feature no matter where he is placed. The characteristic breed type is the dominant factor which causes such attention, and this only goes to prove the great importance of maintaining Standard breed shape or type in all breeds if they are to endure steady popularity, command attention and elicit admiration.

The breed which runs most uniform in shape in males and females is the one that comes closest to being the Standard or pure-bred fowl. Breed type in solid or self-colored fowl should be paramount. The Black Langshan possesses such excellence and purity of type as is responsible for the uniformity of the exhibits seen at our shows.

Standard Langshans

With the renewed interest now being manifested by breeders, exhibitors and judges of Black Langshans the question, "What changes have been made in the Langshan Standard by the Revision Committee?" is again asked. Ever since the 1910 revision, few, if any, changes have been made, as none were needed. We served with Arthur C. Smith and Reese V. Hicks on the Langshan sub-committee at the 1915 Standard Revision, and to the best of our recollection the committee was a unit and stood pat on the old 1910 Standard. That Standard was formulated by breeders of experience and intelligence, whose conscientious and thorough work remain practically untouched to the present day. Indeed, in the fowls themselves, the Standard for shape and color of twenty or more years ago is practically the same today.

As to the Standard illustrations, they have been acceptable to Langshan breeders, so there is no necessity for a change in the male and female illustrated in the 1915 American Standard of Perfection as far as our judgment goes. They were drawn by Franklane L. Sewell, a master breeder of Langshans, years ago, and an artist whose rare skill inspired him to bring out in bold relief the true type characteristics of the Langshan breed of fowl. It represents the American or Croad type at its best, a type found in no other race of domesticated poultry.

The Langshan makes a fine appearance in the show pen. It makes a finer one in the poultry yard, where its shape and carriage and beautiful greenish black plumage can be seen and observed to far greater advantage. The average exhibition cage is altogether too small for a mature Langshan male to show off the symmetrical proportions and style of his body, breast, back, tail, neck, head and leg sections. It is only the proved "cock of the walk" that can do this most effectively.

In judging Langshans in the show room they should be handled—in fact, all birds should be handled. It is the only safe way to get a true line on the body conformation. Color can be examined at the same time and checked off on the judge's card or on the coop entry tag by whatever mark the judge may employ to guide him in his work of selecting the winners.

What F. L. Sewell stated in regard to Langshan shape ten or more years ago is applicable today. In reply to the question "Is the present Standard type correct?" he said: "I will say—both the ideal illustrations in the 1905 of 1910 Standards are safe models to select for the breeder who desires to preserve the original Chinese characteristics. First of all, in judging the Langshan, estimate its depth. By depth we do not mean height. Height refers to the measurement from the ground to the top of the bird's head, which is variable. By depth, we refer to the measurement from

the back to the breast and body, especially the depth of the keel upon which the Langshan carries value in flesh for the table.

"Let the real body be as broad over the back, as thick through and as long underneath as possible. It is that high, stylish carriage of the tail that gives the illusion of shortness of back in the live specimen. The true Langshan of fine spirit will carry its tail high. This should be well spread both from side view and as seen from the rear. The longer the tail, the more showy, if it is evenly carried. The large tail will help to give a balanced style to the large full rounded deep breast."

The word picture Mr. Sewell gives presents the Langshan that in its most symmetrical proportion has length of neck and of limbs to show off to advantage in its carriage and walk and not one of those elongated freaks of the English modern type with a giraffe neck and stilted legs.

The plumage of the Langshan should be smooth in surface and never appear fluffy at the sides or underneath. The body should be of same width the entire length, as nearly as possible. Sewell finds: "With these points in mind, a head of full character and the bird standing on well-formed feet with hips broad and legs set well apart, nature will harmonize the remainder if the stock is pure. If a lot of unharmonious crossing has occurred, nature will help you there as well, for the true Langshan is centuries old and does not improve by crossing."

Regarding the Standard weights, they are in harmony with superior quality. A Langshan can be developed too large and too coarse for the show pen, and suffer some loss in the fine quality of its meat for the table as well. Ten pounds in mature males can easily be reached; in fact, splendid cockerels of that weight have been exhibited and have won at our shows.

Mating

To produce high-class exhibition Langshans demands careful selection of the dams and sires. The Langshan travels "on its shape," so typical shape is the first thing to consider in mating up the pens. The Langshan is a "high stepper" in form, a graceful fowl of symmetrical proportions and sweeping curves, the concave sweep in the back of the male to the fully furnished tail with its complement of sickles and coverts, which are the birth-right and trademark of the Langshan—the great distinguishing features that separate it from the "bally" loose-feathered and low stationed Black Cochins. In the female Langshan any approach to the full, round Cochins cushion of the back should be guarded against, for when once introduced into the breeding pen, irreparable damage will result.

The iridescent greenish sheen or luster on the black feathers is beautiful to behold and admire, but it demands proper mating of the male with the females to produce. Purple or plum color in the plumage is a thing to be avoided. Care should be taken when examining the wing-bows and wing-coverts in order to discover any possible purple barring. Even good-looking specimens in the breeding or exhibition pen will often on closer examination reveal such purple color.

A male sound in color mated with females of rather dull black color will, as a rule, produce both cockerels and pullets approximating closely the Standard color desired. That Langshans do well and will thrive in most all climates has been a well-established fact. In this country they are equally at home in the South, as they are in the North or in England or Northern Asia.

We recall our first opportunity to substantiate this statement. This was some thirty years ago at the Atlanta, Georgia show, where Dr. S. T. Lea of South Carolina exhibited two cockerels of surpassing merit in both shape and color. One cockerel was bred by Ed Kirby of New York, who claimed the bird to be the best he ever raised or had ever seen; the other was an English bird imported from the yards of Miss A. C. Croad, England. Here were two English males bred in different countries that in type, color, size and vigor were equally matched and equally sound. No better evidence of the prepotency of the Croad Langshan blood in every respect could be asked for.

Weak and Wobbly Chicks!

It Doesn't Pay to Hatch Them

Queen Brooder Stove

keeps the house warm for the early chicks. The only stove in which both fire and amount of heat are automatically controlled by one thermostat and one connecting rod.

Start Your Chicks

with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatches years after the cheap machines have been junked.

Sold by Dealers. Send your name for FREE Incubator and Poultry Book.

QUEEN INCUBATOR CO.

1101 N. 14th STREET LINCOLN, NEBRASKA

Remember, it is not how many you hatch out that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. Most of the chicks you lose in the first two weeks die because they do not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Strong, Healthy Chicks

that live and grow. The Queen is accurately regulated, keeping the temperature just right for the hatching chick. No hot and cold changes to weaken the chick's system. The Queen is properly insulated—two layers of wood and one of corrugated strawboard with dead air space. This also helps to maintain an even temperature for the entire hatching period. Both Queen walls are built of genuine California Redwood.

Practical Advice on Feeding the Flock

(Continued from page 1110)

quite similar to the protein in milk and it is generally recognized that milk is one of the most valuable sources of protein, either for promoting growth in young poultry or for making hens lay.

Flocks that are given all the milk they can drink usually are found to be in the best of physical condition, and if the milk is supplemented by sufficient grains to keep the birds in good flesh, egg production from milk fed flocks is nearly always satisfactory.

One hundred hens will consume approximately three gallons of milk daily and where milk is depended upon as the source of animal protein at least this quantity should be supplied.

Where there is any shortage of milk, and this is the case on most poultry plants, the most commonly used substitutes are either commercial meat scrap or high grade feeding tankage.

Results from several Experiment Station tests indicate that commercial scrap and a good grade of feeding tankage give practically the same value as a source of protein for either laying hens or growing stock, and poultry keepers who are short on milk need not hesitate using whichever of these protein supplements can be most easily secured.

The modern hen that is capable of laying two hundred or more eggs in a year, if given proper care, carries on an intensive job of manufacturing and can use more raw material than her gizzard is capable of grinding, so best results are secured where some ground feed is included in the ration. Ground feeds are spoken of as a mash. Mashers may be fed either wet or dry, but the best results are usually secured where a dry mash is fed constantly. When the birds need special forcing some wet mash is commonly added.

Far too many poultry keepers have not learned to treat their hens fairly on the mash proposition. In the country where the disease outbreak was studied, investigators found that nearly every poultry keeper stated that they were feeding mash, but when an investigation was made in many cases a very small box or pan holding probably enough mash for ten or fifteen hens was the only supply provided for large flocks.

A dry mash hopper built large enough to hold at least a week's supply of feed for the entire flock and providing sufficient trough room so that every hen can eat all she wants every day, is the most satisfactory way of feeding a dry mash.

At least one foot of hopper feeding space should be provided for each dozen hens kept.

Mash formulas vary widely in different sections of the country and there are doubtless dozens of good mash mixtures.

Mash formulas ought to contain the food elements which are cheapest and most palatable, and for the country as a whole the wheat by-products, commonly known as bran and shorts, are

Get Winter Eggs!

See to it that there is song and cackle, scratch and action, going on in your poultry yard.

That's when the eggs come.

Feed

Dr. Hess Poultry

PAN-A-CE-A

See them get busy. It gives hens pep.

Nux Vomica is what does it—that greatest of all nerve tonics. A Pan-a-ce-a hen can't hold still. It's her good feeling that makes her hop around.

Pan-a-ce-a has Quassia in it to make hens hungry. Great combination! One makes them eat—the other helps them digest what they eat.

No dormant egg organs when that combination gets to work on a hen's system. You just get eggs—eggs.

A Pan-a-ce-a hen is always a hungry hen—an industrious hen. She gets off the roost winter mornings, ready to scratch for her breakfast.

Tell your dealer how many hens you have. There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum
For fewer hens, there is a smaller package.

Everything About RHODE ISLAND REDS

Remarkable Book Sent FREE

Rhode Island Reds

The Best All Purpose Breed

If you already breed R.I. Reds, double your capacity. The demand for these great money-makers is bigger than ever. If you are not a "Red" breeder, act wisely and begin at once. Rhode Island Reds are the most beautiful, most popular, and most useful fowl on earth. They are sure winners anywhere; confined, or on range. They readily adapt themselves to all conditions, are hardy and easy to raise, have an exceptionally strong constitution—resist disease to a remarkable degree.

RHODE Island Reds will make you more money than any other poultry breed. They mature early, make a splendid market fowl, with sweet, juicy and fine flavored meat. Chicks reach broiler or frying size earlier than other well-known meat breeds. Reds are superior exhibition fowls. More Reds win at shows than other breeds. Hens make excellent mothers, yet not persistent setters. Ideal fowl for both farm or city lot.

Reds Lay More Winter Eggs Than Any Other Breed

Bred to Standard requirements, Red female is known to be among the world's greatest all-round layers. Her specialty is big brown eggs in cold winter months when prices are highest.

At all egg-laying contests, Rhode Island Reds, during fall and winter, have carried off more honors than any other breed. At 1920 National Egg Contest Reds won highest honors in both pen and hen classes. Highest pen over all breeds averaged 246.6 eggs per bird; Highest individual hen, 296 eggs in 365 days. R. I. Red pullet in Massachusetts laid 309 eggs in 365 consecutive days. Dr. Sanborn produced R. I. Red that laid 307 eggs in 365 days. Rhode Island Reds produce a lot of eggs when eggs are scarce and high. They are not surpassed by any breed when it comes to making profit for their owner.

Rhode Island Red Journal 3 Years For \$1.00 and "Blue Ribbon Reds" FREE

Everybody who raises or contemplates raising Reds should subscribe to the Rhode Island Red Journal at once. It's the only journal in the world devoted exclusively to Reds. It tells how to make big money with them. Tells you where to buy and sell, how to get greatest pleasure, most profit. Keeps you in touch with all leading Red breeders; tells everything you want to know about R. I. Reds. It is the "Red Breeders Bible." Those who know say they wouldn't be without it for \$5.00 a year. Published Monthly, 50c a year; 3 years \$1.00. Each issue contains 80 to 120 pages of intensely interesting and valuable information.

There is nothing in the world that will help you make more money with Reds than Rhode Island Red Journal and "Blue Ribbon Reds". This remarkable book is given absolutely free with a 3-year subscription to the Rhode Island Red Journal at \$1.00. Don't lay this advertisement aside; but sign the coupon right now. Pin a dollar bill to it. Mail at our risk today. Book and Journal will start at once.

RHODE ISLAND RED JOURNAL, 341 Democrat Bldg. Waverly, Ia.

"Blue Ribbon Reds"

Most remarkable book on R. I. Reds ever published. A book no breeder of Reds or anyone planning to raise Reds can afford to be without.

By means of the most remarkable set of Rhode Island Red Illustrations ever produced, W. H. Card, secretary of the Rhode Island Red Club, and the greatest living authority on REDS, in "BLUE RIBBON REDS," shows in a way so simple that every beginner can understand what constitutes the correct type and color of Rhode Island Reds. There are twelve drawings illustrating type and fourteen illustrating color. These drawings show the ideal Reds, both male and female, as well as the various shape and color defects most commonly found. Mr. Card also points out which defects are serious and which are of only minor importance.

Here are a few of the many subjects in "Blue Ribbon Reds"

- An A-B-C Course in Judging Rhode Island Reds (in five lessons)
- How Rhode Island Reds Originated
- Mating Rhode Island Reds for Color and Shape
- How to Obtain Fast Growth and Large Size in Rhode Island Reds
- How to Breed up an Egg Laying Strain
- How to Cull Rhode Island Reds
- How to Prepare Rhode Island Reds for the Show Room
- Which is the Correct Rhode Island Red Color
- Disqualifications
- Feeding Poultry at All Ages
- How to Treat Sick Fowls
- How to Get Rid of Lice and Mites
- How to Build Poultry Houses and Equipment.
- Standard Weights
- Linebreeding

Special Illustrated Features

A picture of Rhode Island Reds in natural colors, suitable for framing, the latest and best ever published, copyrighted 1919. Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICEMIST." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Lice-mist vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54, Quincy, Illinois.

POTTER & CO., 10 Forest Ave., Downers Grove, Ill.

perhaps the most satisfactory foundation for a mash.

Wherever there is not sufficient milk to supply three gallons daily to each one hundred hens the mash needs to be supplemented with commercial meat scrap or tankage to insure good health in the birds and to stimulate egg production. One of the simplest mashes and one that has proven thoroughly satisfactory for thousands of farm poultry keepers is made by mixing 100 lbs. wheat bran, 100 lbs. wheat shorts, and 50 lbs. commercial meat scrap or tankage. Another simple mash for use, particularly with the lighter breeds, where there is little danger of getting over fat, is made by mixing 100 lbs. wheat bran, 100 lbs. wheat shorts, 100 lbs. corn meal, and 100 lbs. commercial meat scrap or tankage.

The lime needed in manufacturing egg shell is best supplied by keeping crushed oyster shell constantly before the hens. The other mineral elements needed in developing the egg and keeping the hen in good health are commonly present in sufficient quantities in the ordinary feeds.

The Vitamines

Scientists are devoting considerable time at present to so-called protective feeds, or foods containing vitamins, which help keep the fowls in good health. It is known that milk, eggs, and the leafy vegetables contain the so-called protective elements and every poultry ration should contain one or the other of these groups of feed.

Since a large part of the fowl's body and a considerable share of the egg is made up of water, it is of the utmost importance that both hens and growing flock be supplied with unlimited quantities of drinking water.

The question of green food in the ration is one about which there is perhaps less uniformity than on any other subject connected with poultry feeding. Every one admits green food is a good thing and most poultry men believe that green food is absolutely essential for proper growth and development of young stock.

Some investigators now claim green food can be dispensed with in commercial laying flocks without any particular injury to the birds and claim that it has not paid to go to the trouble usually necessary to provide green food in the winter in order to keep the birds in good condition at that time.

Those who maintain that the laying flock can be kept in good laying condition during the winter without green feed, maintain that the principal benefits derived by laying hens from green food is the laxative effect, and usually provide the birds with Epsom salts or other laxatives at regular intervals during the period when green food is not supplied.

For the poultry keeper who is uncertain about the ration he should feed during the following winter, the ration herewith presented is suggested as one that is simple and that has given excellent results in a large number of flocks when fed in liberal quantities: For the scratch grains feed simply shelled corn, or shelled corn in combination with any other farm grains,

BETTER THAN GREEN

FOOD OR MEAT SCRAPS

Dissolve WACKER'S B. T. G. F. tablets in the water; you get larger eggs, better production. No MEAT or Green are needed; feed is turned into eggs instead of all fertilizer, making your Pullets lay early. In time of need Wacker's Roup Tablets will not fail you. You get results or your money back. 600 Tablets \$1.00; 1300 \$2.00; 5000 \$6.00. C. O. O. Orders Promptly Filled.

WACKER REMEDY CO., Box 157-22, Camden, N. J.

such as corn and wheat; corn and oats; corn and kafir corn; or even kafir and wheat. One of the best rules for feeding scratch grain is to feed lightly in the morning so that the birds will consume large quantities of dry mash and then give all the grain that the birds can clean up at the evening feeding.

For a dry mash to be kept constantly before the hens, the mixture of 100 lbs. wheat bran, 100 lbs. wheat shorts, and 50 lbs. commercial meat scrap or tankage is practicable for nearly the entire United States.

The usual standard for measuring the amount of mash that should be given is to stimulate the birds to eat at least 1 lb. of mash for each 2 lbs. of grain by holding up on the grain until sufficient amounts of mash are consumed.

Practical Poultry Hints for the Month (Continued from page 1105)

Epsom salts to clean out the bowels. It is too chilling and is liable to make the hens mope about and lose interest in life for the time being. Epsom salts work very well in warm weather, but a little castor oil will prove more satisfactory during the cold season.

When you are putting the leg bands on the birds put them on the right leg of the pullets hatched the even year and on the left leg of pullets hatched the odd year. Then you can tell at a glance just how old the birds are and you will not have to catch them and look up the number. If you keep a hen over two years old take off the band leave the shank clean.

Begin 1923 right by keeping a diary of your poultry work. The records may be brief, but should be made with some approach to regularity. Note weather conditions, low and high temperatures, rainy and snowy days, the amount of rainfall. Put down whether the crop turned out good or bad. How did eggs hatch and did the chicks live? Prices of eggs and feeds at different dates, wages, prices of commodities, etc. Such a diary will not only be very interesting but will be very valuable for comparison in later years.

When your fowls get home from the shows it is a wise plan not to put them at once in the house with the other fowls. Keep them separate for a few days and watch for symptoms of disease, because roup, chicken pox or sorehead are easily transmitted from one fowl to another in the showroom. As a precaution use an antiseptic wash on the heads and throats of the birds when they arrive home. It is easier to keep disease out than to get it out.

If frost has nipped a comb or two for you and the tips have turned dark, twice a day apply an ointment of six parts vaseline, two parts glycerin and one part turpentine. This will help to get the blood circulating and reduce the swelling. If you notice a frosted comb before it is thawed be careful not to warm it too quickly. Do not take the bird into a warm room, but thaw it out by gently manipulating with the fingers dipped in glycerin.

In cold weather the best time to feed a moist mash is at noon, not in the morning, because the fowls will spend

Now Buys the EGGETTER

For 40 Hens or Less

Delivered Fully Prepaid anywhere in the U. S. by Parcel Post for only \$6.85

This little Egg-Getter is the biggest little proposition ever made in a Vapor Bath Grain Sprouter. Our little sprouting machine was devised by W. H. Monroe, the inventor of the first grain sprouter and is offered you by the oldest grain sprouter manufacturers in the U. S., the Close-To-Nature Company, hence you know it has got to be all right. It is 13 inches square by 28 inches high and holds 10 to 12 quarts dry grain—a capacity as large as some manufacturers rate for 100 hens. Besides making a feed that is immensely superior to that made by any lamless. The back-lotter who has two to four dozen hens will find the little Egg-Getter highly valuable.

Made of galvanized sheet steel strengthened by a frame-work of cypress, the wood that never rots. Has 4 trays which may be divided into 4, 6 or 8 compartments as needed by means of movable partitions. Fitted complete with lamp, thermometer, partitions and directions.

For "More Eggs"

Why Waste Your Money on a lamless (so-called) sprouter that produces the poorest grade of slow-sprouting, wiry, tough, oats, when for just a little more money you can now get a genuine vapor-bath sprouter that makes the highest grade of quickly sprouted, snappy, succulent sprouts,—the kind that the hens relish so highly that they eat great quantities of it and respond with the big increase in egg yields. Use it in any convenient place, the kitchen or dining room, or it is pretty enough to be used in the bay window with the flowers.

Let Us Mail You One Order direct from this advertisement

and your sprouter will go by insured Parcel Post, as quick as the U. S. mail can take it.

1000 EGGS In EVERY HEN

If You Keep Chickens CUT THIS OUT

"The great trouble with the poultry business has always been that the laying life of a hen was too short" says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through

cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how. If you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860 T Herald Bldg., Binghamton, N. Y., and a free copy of "The 1,000 EGG HEN" will be sent by return mail.

IN ONE YEAR**

too much of the day loafing. Also do not feed at night because the mash does not stay with the fowls all through the night. Scratch grains in the morning, moist mash at noon, whole or cracked corn at night and dry mash all the time is the best general cold weather feeding.

The small breeder who has just a few good birds to sell often makes the mistake of sacrificing them at home or on the market. A small classified advertisement in a good poultry magazine will help him sell those birds and get what they are really worth. Do not sell good birds on the market. This month and January are the months to advertise such birds for sale. Get rid of them before the pens must be mated up.

Another mistake most beginners make is to use inferior birds in their breeding pens because they only have a few extra good ones. As a matter of fact they will be vastly better off, will make much better progress if they will be content to raise chicks only from the few good ones. One does not absolutely need ten hens for each male. If he has only four good hens he can shut the male up part of each day. Do not raise scrubs. Breed from your best only. Not how many but how good should be the program.

Be sure to attend the nearest big poultry show this season. Take in all the nearby smaller winter shows too, that you possibly can. Enter a few of your best birds in a good show and find out how good they really are when compared with the best others can produce. You will know more about your favorite breed at the close of the season than you ever did before. There are a whole lot of "better birds at home," but it is the birds in the show room that count largely in advertising value and in satisfaction to the breeder.

Winter colds are usually contracted as a result of drafts. Starting this way, it is my judgment that they spread from individual to individual by contagion and infection. There may be in the flock a bird that has not the constitutional vigor to resist the atmospheric changes that occur in the fall of the year, and so develops a cold. Drinking from the same dish with the rest, roosting on the same roosts, this bird becomes a germ carrier and a center for the spread of the disease. Such birds should be segregated immediately as soon as discovered and treated separately or killed and buried. In this way your troubles along the line of colds are reduced to a minimum.

December is a bad month for fowls to form all sorts of bad habits. Having been shut up they develop cannibalistic tastes, and try to eat up one another alive. Males are the worst sufferers. Impelled by a sense of gallantry, or by just plain foolishness, a male will stand still and let himself be devoured of feathers by his mates. They begin by picking the feathers about the head and neck, then pick the comb and wattles, and keep picking away until the male is greatly weakened from the loss of blood. The cure for this, as well as any other bad

ANOTHER X-RAY INCUBATOR IMPROVEMENT

The new corrugated redwood and pressboard combination walls makes X-Ray perfect. It is this year's brand new feature and is the greatest improvement ever made in any incubator and brooder.

1923 X-RAY

Surest and Easiest to Operate
will hatch your eggs.

This new combination feature makes X-Ray the one incubator that will positively hold steady, even heat and moisture—makes it still easier and less expensive to operate. You will want this new X-Ray Perfected machine to hatch your eggs, to get every chick.

It will pay you to throw away your common, old-fashioned machine to use the new X-Ray Perfected Incubator and Brooder. Read all about the many X-Ray improvements in our 1923 new X-Ray book. Sent Free. Write quick—these new books and machines are going fast. We prepay transportation charges.

habit, is prevention. Keep the hens busy all the time by making them work for every bit they eat. Hang an old salt fish up in each pen or a piece of cheap meat for them to pick at.

December is a good month to overhaul the incubator and clean it up. Use a good coal-tar disinfectant, warm water and soap for cleansing the interior of the egg chamber, egg trays and all parts which come in contact with the egg or chick. A good yellow soap may be used with the disinfectant solution. The solution should be one gill of the creolin to two gallons of hot water. Dry all removable parts in the open air and sun. Make sure that the lamps are clean, burners in good order, new wicks and chimneys free from soot. See that the regulator and all operating parts are in good working condition.

Close up the year by taking an account of the stock. See if you can decide whether the year has brought profit or loss. Price up your stock as you move on to the new year, that you may have some figures as a base to work from when you end another year twelve months later.

The Choicest Poultry Meat of the World

(Continued from page 1107)

7. Clean the drop boards at least once per week, giving them a strong disinfectant spraying each time, especially in the warm weather. Look most carefully and persistently for any mites, and examine for body lice frequently. Vermin soon sap the vitality of the capon, and he goes to pieces quickly, with little chance of recovery.

8. In addition to this I remove and change the floor litter whenever it seems necessary, varying with the time spent in the houses.

Capons cannot stand much inclement weather without adequate protection. They catch cold rather easily, and a draft and damp proof house is absolutely essential to their welfare.

If regular laying quarters are converted into capon houses, be sure to make partitions every twenty to twenty-five feet to prevent floor drafts.

If colony houses be employed they should be made tight and as light and comfortable as possible.

A large flock of capons requires constant watchfulness. I pick out any one that looks "off" the minute I see him, and give him individual treatment, if it is worth while.

One thing I use freely and frequently: Epsom salts. A pound of salts in the noon moist mash for 500 to 750 fowls twice per week seems to keep their bowels in good condition, the fowls freer from intestinal parasites, and the appetite keener. A capon easily falls prey to these unwelcome guests, so the sooner they are speeded on their way, the better.

Care should be exercised not to feed too bountifully during the day. Induced exercise is needed to keep capons from getting sluggish. If the morning scratch seems to take the edge from their appetites for the noon

Now's The Time

Mr. Poultryman, when our profitable averaging help means more poultry business—bigger profits. Ads, booklets, mailing lists, catalogs, dealers. State what plainly. Poultry Service, Box 33D, Dodgeville, Wis.

mash, reduce the former to little or none at all.

Irrespective of whether you run your capons in large or smaller units in summer, when winter comes, they should be run in fairly small flocks. I partition a 500 capacity laying house into five sections, placing between 80 to 90 capons to each. This seems to provide enough room. They are not so active as other chickens, so do not run up and down so much.

My winter feeding schedule is much the same as the summer one, except that I use whole corn liberally in the night feeding. The moist mash may be continued if fowls still relish it. A hopper with grit and oyster shell, plus a good supply of laying mash of some kind, will furnish the needed ration, plus green food. Whatever kind seems best for you will do. Sprouted oats are always welcome, as are cabbages, sugar beets, etc. The fowls should be fed in fairly deep litter to keep them in active condition until ready to fatten, otherwise they become lazy and a prey to their inactivity.

In arranging the quarters, the nests are naturally eliminated. Also the drop boards should be between eighteen inches and two feet high, rather than the usual three feet. If they are not already in your houses, it is a good plan to place slanting runways so that the fowls may easily mount to their sleeping quarters. Otherwise, as they grow heavier and less active, you will find them sleeping on the floor. This is undesirable for a number of reasons.

Generally speaking, it is better to keep capons separated from the rest of the fowls. The roosters, and even the hens will often attack, annoy, brow-beat, and generally kill them by wearing their spirit down, of which they have but a small stock in any case. Being somewhat more susceptible to diseases, they may endanger valuable breeders and layers. I have heard of one prominent breeder who went into capons rather extensively and very enthusiastically. He found the two did not mix well, and gave up the capons after learning a few rather expensive lessons.

Unquestionably the capon stands unique as a table fowl. If given the proper surroundings and a thorough knowledge of his needs is combined with a correct feeding routine, he does very well, and can be the means of much profit. Without these essentials, no poultry business can spell faster nor more complete disaster than a commercial capon enterprise.

The capon's future is very bright. It is to be hoped that he will be presented with a less deceptive glamor than have other branches of the poultry world.

"And the Truth shall make you Free." Yes, free from avoidable losses. Free from failure. Free to enjoy the profits he is able to bring you. No man has a better chance to succeed with capons than the one who weighs them first in the balance. The scales can be tipped to Success with wonderful ease, if the weight of Knowledge be there to overcome Ignorance, False Propaganda, and all other too familiar "poultry bunk."

Old RELIABLE INCUBATOR

The Old Reliable Standard MAMMOTH

A typical instance of Reliable leadership—the new Mammoth sectional grouping system that provides larger units for larger hatching plans. Reliable users, and many others, will welcome this larger unit system with their individual growth caused by the general expansion of the poultry business. The Reliable Mammoth puts an end to incubation limitation and points the way to larger development and greater profits. It embraces every well-known feature of the Old Reliable—has the same long line of worthy ancestors that have become famous in the service. It is the same dependable, efficient, easy-to-operate, convenient and economical Reliable, except now it is "grown up"—ready for bigger things.

Made in both Hot Air and Hot Water Styles, in sections of 1,100 egg capacity. These sections are so built that they may be used in singles, doubles or three-high. The Mammoth enables you to get maximum incubation in the smallest space. Three machines take up no more room than one. Here is the world's greatest hatcher. The sure way to fewer worries and larger profits. The greatest test of Reliable superiority is found in the far-flung thousands of satisfied users in all quarters of the globe. Every Reliable product is sold upon an absolute money-back guarantee.

Various
Sizes

Reliable Standard Blue Flame Hover

The Reliable 1923 model Wickless, Valveless, Oil Heated Colony Hover is "fool-proof" and safe. It embraces the latest

and newest improvements in Hover construction. Saves time, money

and trouble. Nothing to wear out or break. It takes the guess-work out of brooding and makes chicks grow faster and stronger. Built of galvanized steel. Burners are carefully tested and adjusted to produce even flow of fuel and steady flame. No clogging—no overflow—no going out. Poultrymen acclaim this the most successful hover on the market.

Reliable Standard Coal Burning Colony Brooder

Strong enough to last a lifetime. Improved feed pouch increases coal capacity 10 per cent. Has screw plate draft on ash pit door to be opened when burning soft coal. Burns hard or soft coal with equal success. Equipped with two double disc thermostat wafers, insuring positive, accurate and dependable heat regulation. Built of heavy gray cast iron, all parts strongly bolted together. Has seven-inch fire-proof base, with asbestos protecting pad attached to lower plate, and air space insuring safety. Self-cleaning and no clogging. The fire bowl is specially designed to keep grate clean at all times. Perfect heat radiation. Canopy throws off pure, fresh, warm air—self-ventilating.

GOOD FLOCK AVERAGES

By Willard C. Thompson

The permanence of any producing industry is always a matter of vital consideration both for those who contemplate embarking into the field and for those who are engaged in such pursuit. Throughout the length and breadth of this country today there are hundreds and thousands of people who are interested in poultry raising as a source of revenue and profit. In many instances the poultry flock must be a means of livelihood. In many other instances the keeping of the flock is only one of several sources of income, but nevertheless it must be a business success if it is to be continued.

In this day the various lines of farm production are passing through a critical stage, in a way. Those branches of agriculture which persist are to be those which are based upon a sound business basis, and which can prove to a certain degree, at least, that they are possible of permanent place among those occupations which will render a fair living to people.

The poultry raiser is producing a type of foodstuff that is an indispensable part of the daily diet of practically all people. The demand increases, and must continue to do so. It seems scarcely possible that a time will ever come when people will be able to substitute other materials for eggs in the preparation of their foods. The poultry flock owner is fortunate in that his product has a natural and constant demand on the market.

It would seem that the establishment of poultry raising on a permanent basis must be a matter of adjusting the various factors pertaining to economical production. The more efficient practices of flock handling and management will result in lowering the cost of egg production, and increasing the margins of profit, so that the egg producer, like all good business men, may have a fair return for money, time and energy invested. He is entitled to it.

This is midwinter time. It is an especially good time for the poultry raiser to do a bit of thinking concerning the problem of bettering the business condition of his poultry flock production. In the opinion of the writer one of the most important factors in bringing about a more economical and more efficient egg production, and therefore increased profits for the producer and better and more satisfactory products for the consumers, is the increasing, year by year, of the average egg yield per year per hen. The poultry raiser who finds no increase in the average egg yield of his hens as the seasons roll 'round is standing still as a business man. There is something wrong with the system on which he operates. The permanent type of poultry husbandry which is to persist and become a solid part of the agriculture of this country in years to come is that type which sees a certain steady development and improvement. There are several questions which very naturally arise.

How is this to be accomplished economically? Is it really possible for

"MUCH HANDIER THAN A LAMP"

In the winter time, growing green food, rich in vitamins, makes hens lay better. The value of sprouted oats for this purpose is well known among most poultry raisers. With a Little Putnam Stove and a couple of hours spent following simple directions you can make your own Sprouter, and have this living, growing green food all winter.

A Little Putnam Stove gives satisfaction. Burns a whole month without attention. Read what M. A. Albrecht, Pomeroy, Pa., says: "Please send me another Little Putnam Stove. Your stove beats a lamp all to smash and is much handier." Your dealer can supply you. If not, send two dollars to I. Putnam, Route 251-E, Elmira, N. Y., and one will be promptly mailed to you, postpaid. Satisfaction guaranteed. Read the advertisement on page 1130.—Adv.

every poultry and egg producer? What can the poultry flock owner do in the immediate future in order to fall in line with such a system of improvement of flock quality? Are we talking about something that is good subject for preaching but not practical for putting into operation?

An Answer

According to statistics it requires, on the average for the general poultry industry, somewhere between eighty and one hundred eggs to be produced by the average hen in order to pay for the total cost of maintaining that hen for the year. After she reaches some such point, as one hundred eggs, therefore, she begins, other things being equal, to return an interest on money invested. The average of the flock, consequently, must exceed this mark before it is profitable to keep that flock. It is bad business to maintain a poultry flock that is a financial failure. The interest earned by a producing flock of hens will be measured by the amount by which the actual average egg yield per year per hen does exceed that figure which represents actual cost of maintenance. The higher the average may go, the greater the profits. When the average reaches the vicinity of one hundred and fifty eggs per year per hen the returns on investment amount to very real figures, and when the averages climb up beyond that figure the poultry business becomes one of much significance. It is very distinctly up to and necessary for the poultry flock owner to set his star high, and establish some such aim as the two hundred egg average. Never will he attain near that figure unless his aim has been that high. The premise that this high average egg yield per year per hen is sound, and has been proven again by an investigation of poultry flock records, both as to costs and production. The writer has studied the relationship between flock averages and profits on many hundreds of poultry farms and is absolutely convinced that the mightiest factor in establishing profits in poultry keeping is this securing of a high fecundity, a high average individual performance.

How is this to be accomplished? The story might be long, but here an attempt is made to condense it into a few pertinent facts.

Before any flock of hens can become efficient egg producers and can establish anything like a high average egg yield per unit, that is per hen, there must be bred into such a flock a capacity to produce a large number of eggs within the span of a year. It is a false idea that any hen, no matter how bred, can be fed and handled so as to secure a high egg performance record. It is fundamental that every poultry raiser who would be engaged seriously in his problem of securing economical production should appreciate that his fowls must have an inheritance that gives to them a capacity to use large amounts of food and to respond to environment and care, and therefore to lay a large number of eggs in a given time. Poultry breeding, done systematically and based on

"No Lice on Me!"

The U. S. Dept. of Agriculture has solved the lice problem for you. Bulletin 801 says that after numerous tests with many kinds of material, nothing proved so effective as

Sodium Fluorid

Write to us for a copy of this interesting, helpful Gov't. Bulletin. We will gladly mail you one free. It tells how you can easily, quickly and permanently get rid of lice on your poultry.

Southern Agriculturist, a leading farm paper, says: "Sodium Fluorid is the only lice remedy that will kill all kinds of lice."

Clemson Agri. College, So. Car., says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried." Over twenty other State Exp. Stations say the same.

R. T. Parkhurst, Head Poultry Husbandry, Idaho Agri. Exp. Sta., says: "It (Ivo-San Sodium Fluorid) is a very satisfactory control measure for lice. For the price, I consider your product superior to any I have handled."

"I used Sodium Fluorid on my chickens 3 years ago and haven't had a louse on them since." (Andrew Smail, Rock Springs, Wyo.)

IVO-SAN SODIUM FLUORID

is the best brand, being air-floated, fine as flour, unadulterated and all active. Use it dry or dissolved in water as a dip. Costs only 1/2 cent per fowl.

Also kills cockroaches, ants, waterbugs, lice on animals and plants. Two lb. can, \$1; 4 lb. can, \$1.75; 8 lb. can, \$3. Postage prepaid. Points outside the U. S., 10 cents per lb. additional.

Send today for your Ivo-San Sodium Fluorid; get rid of lice for all time and give your poultry a chance to increase your profits.

Get More Eggs

**Hang a QUICK-LITE
Lantern In Your Hen House
for Increased Yield**

Longer feeding hours increase the egg yield. Poultrymen everywhere are making big money by simply placing a lighted Quick-Lite Lantern in hen houses a few hours each night and morning. You, too, can get more eggs the same way.

Brighter than
electricity; one
Coleman Quick-Lite
Lantern lights the
average hen
house.

The Coleman Quick-Lite

Makes and burns its own gas from common motor gasoline. Lights with a match. Economical—costs a little over a cent for three hours use. 300 candle power of brilliant white light. Brighter than electricity. Gives more light than 20 oil lanterns. Absolutely safe. Burns in any position and in any wind. No danger even if tipped over. Tested by egg producing authorities and has their unqualified approval.

For very large hen houses we manufacture the same form of lighting in a complete plant, equipped with fixtures, globes, etc., giving more light than the lantern. Write for information about increasing egg production by using Quick-Lite lanterns and lighting plants.

30,000 Dealers everywhere sell Coleman Lamps, Lanterns, and Lighting Plants. If yours can't supply you, order direct from nearest house, addressing Dept. AP-20.

knowledge, is back of any attempt to raise the average egg yield.

Poultry breeding consists of many things. Right now, this winter, however, there are a few parts of it which can be started which will start the ball rolling, and show marked improvement in another year.

Select some of the best pullets in your flocks as early in December as you can and place these pullets in a pen fitted out with trap-nests. Do not attempt to trap too large a number of pullets nor too large a percentage of the flocks. Buy an economical and efficient trap-nest, or send to your State Experiment Station for the plans by which you can make one at home. Allow one trap-nest for each five pullets. Keep a faithful and accurate record of the individual egg production of these pullets. Trap them throughout the year, until next November. From that group of pullets you will have the basis for a breeding flock of hens of absolutely known egg-producing powers. You will save for breeding purposes only those hens with really valuable records. They will be mated with selected males, and their chicks pedigree hatched. The whole object of this suggestion is to secure pedigreed cockerels for use eventually on all the flocks of hens from which hatching eggs will be saved. The pedigreed pullets will always be the most valuable on the place. There is a definite and necessary place for the trap-nest on practically every poultry plant.

Watch the rest of your pullets carefully. As they begin to lay mark them. Some such system as this works easily:

During the first two weeks of December put a blue celluloid band on the shank of any pullet showing by external characteristics that she is undoubtedly started in egg production. This is a mark of distinction, as it distinguishes those pullets which possess that always desirable factor of precocity. That means an ability to start laying early in the production year, and laying during winter months. Precocious hens are usually to be found among the highest producers for the year.

During next April sometime when convenient handle the pullets again, and at that time place a white band on those which are laying, this denoting intensity of production, another characteristic of good layers. The blue banded pullets will in all probability have a white band added to their decorations. Under the trap-nests good pullets, laying intensively, will or should average somewhere about twenty-five eggs, or more during March, April and May. This average figure is usually taken as a numerical valuation or expression of intensity.

During next late July again go over the pullets and bestow a black band on those which are still laying, for such fowls have the important characteristic of persistency.

Then, as next fall approaches, your pullets will be grouped in such a manner that culling and selection will be easy and more accurate. This simple system of banding the pullets is a crude but effective system of book-keeping. It should be operated on all pullets which

You Can Be Sure of Your Hatches With Prairie State Incubators

PUT in the fertile eggs—turn them twice daily—fill and trim the lamp each day. It's as simple as that. But the results are sure—big hatches of the best chicks you ever saw.

If you have had poor results from other incubators, you may doubt, but remember we have been improving the Prairie State Incubator for nearly forty years, until now it is the acknowledged perfect incubator, which you can use with absolute confidence.

Your success depends upon the incubator. You need not experiment—get the Prairie State. It is guaranteed as to percentage of hatch and quality of chicks and for ten years of service.

Prairie State Brooders raise the little chicks with practically no loss. Many styles.

Write for the complete catalog and learn the facts. And do it NOW.

Let Albert Angell Jr., Guide You Right ~

Our Poultry Expert, Albert Angell, Jr., is at your service. Write to him whenever you need assistance and you will receive a reply that will be of great value to you in your poultry work.

We secured the services of Albert Angell, Jr., to head our Poultry Feed Department because of his world-wide reputation as the greatest poultry and feed expert of the 20th Century.

Albert Angell, Jr., has come face to face with more poultry raisers than all other poultrymen. His lectures and motion pictures have packed some of the largest halls in the country and at the present time he is booked for nearly one hundred lectures on his subject of "SCIENTIFIC POULTRY FEEDING AND MANAGEMENT."

If you have not heard Albert Angell, Jr., by all means take advantage of the next opportunity. Watch out for him—ask your feed dealer when he is expected to visit your vicinity and take it from us—you will have the greatest treat of your entire poultry experience.

are not under the trap-nest. It is readily seen that those pullets which finish the year and present themselves at next October with three bands, blue, white and black, will be selected for keeping over through the coming year, for they possess precocity, intensity and persistency.

The third point relating to breeding high capacity fowls, as a strain, lies in selection, by rigid methods, of the yearling and older hens which are to produce the hatching eggs this spring. Do not keep too many. Keep rather a few of the very best, basing your selection upon those external characteristics which hens develop as they finish the moult and come out of the effects of having produced heavily as pullets. Size, condition, body conformation, handling quality, depth, length, and width of body, and similar points are important. Mate with these carefully selected hens, cockerels from high producing mothers. Go out and buy them, if necessary. Do not waste a year. Pedigreed cockerels are worth the money they cost. Much can be done toward increasing the productive capacities of pullets raised next season by starting at this point right now. Think it over. Act.

High average egg production per year per hen is the result of proper feeding, housing and management after productive hens are available. It is not the province of this article to enter into a discussion of feeding for winter eggs. That has been covered in a previous contribution. But it is pointed out that in order to secure a high yearly production we must secure winter production. Hens cannot loaf during the winter and come through the year with high averages. In a nutshell, manage well bred pullets somewhat as follows:

Confine to sanitary, light, well-ventilated, roomy quarters from November until about April. This will keep them near to the dry mash supply and force its greater consumption.

Feed about twelve pounds of grain per day per hundred pullets, using two parts of cracked corn and one of wheat. If electric lights are used increase the amount to fourteen.

Keep a constant supply of dry mash before the layers all the time and so manage the flock as to secure a maximum consumption of dry mash.

Watch the health of the fowls zealously. Keep them well.

Force the fowls to exercise.

Furnish green, succulent food continuously throughout the year.

"What are eggs today?"

"The same as any other day—little oval things with shells around 'em."

You Can Get More Egg-Money

With egg prices going up you should have more eggs to sell. Think what an *extra* dozen or two of eggs will mean each day in cash.

Your layers should be shelling out eggs aplenty. And they will if you help them. What they need is a natural tonic to put them in laying condition. You'll find that tonic in

Pratts Poultry Regulator

Mix it daily in the feed and watch results. See them "pick up" in general health—improve in energy and vitality—and hustle to the nests. That's been the experience of successful poultrymen for over fifty years.

Pratts Poultry Regulator not only builds health and strengthens the entire system, but helps reduce feed costs. It prevents feed waste by improving digestion—that means less outlay and correspondingly larger profits.

Test it at our risk. Pratt dealers everywhere are authorized to supply all Pratt Preparations on this guarantee:

1000 EGG GERMS IN EACH HEN

New, amazing discovery works wonders. Oscar Vanleer, chemist, after years of scientific research, creates sensation, proves each hen hatched with one thousand egg germs in body. Vanleer discovers tonic to develop those germs. It is scientific formula. Nothing in the world exactly like Vanleer Tonic. It's new—different. Contains secret ingredient not found in any other tonic—the one ingredient which makes Vanleer Tonic so effective. Results marvelous. Hens average 250 eggs annually. Lay continuously four years. Eggs produced in all seasons. Keeps hens healthy—always happy and scratching. Old hens lay longer—pullets start earlier. Turns loss into profit. Shortens molting period. Increases egg yield hundred per cent. Vanleer formula superior to any other tonic in existence. Thorough trial will convince of its startling superiority. Gives vigor and stamina. No trouble or bother. Give with food. Costs nothing to use, as extra eggs more than pay for Vanleer Tonic. Every box sold on money-back guarantee. Mailed to you post paid. Send at once for liberal package. Only costs one dollar. If not as represented after thorough trial according to directions, we'll return money. You run no risk. Just send name and address and pay postman on delivery, or pin paper dollar to your letter. By all means get this amazing tonic. Address, SCIENTIFIC FARM PRODUCTS CO., 25 Lucas Bldg., Monroe and Ontario Sts., Toledo, Ohio.

More eggs for market—better eggs for hatching.

Egg Capacity

There is the finger measurement method of estimating egg-type, a method of real merit when intelligently applied, but big-handed judges and small-handed judges must differ on the score. Shall judges standardize their fingers?

In some directions standardizing has

been pushed too far. The Leghornizing of other breeds is not justified by the trapnest records at the laying contests. A comparison of Leghorn performance with that of other breeds puts Leghorn leadership in doubt.

Uncle Sam is almost as fond of chicken dinner as he is of fried and scrambled eggs. This point in favor of heavier breeds should not be overlooked.

That our Uncle Samuel does like eggs is borne out by the unusually heavy stocks of cold storage eggs put away in the refrigerators this year that are now melting away like snow in a spring thaw. The eggs are going into the frying pan. At the same time the vintage of November 1922, is being absorbed at prices as high as \$1.00 a dozen retail for the best in the great market of New York City.

We need utility; the cook must have them to appease our Uncle Samuel's appetite.

There may be some bunk about utility judging. There may be some tricksters who fade out the shank color by covering their chicken runs with coal ashes, or swell the combs by feeding meat and cooping in a warm conditioning room. But, thin pelvic bones, large capacity and the other external characteristics of high fecundity are easily a matter of breeding, feeding and management. The 'fakir' who is with us in all walks of life will perspire freely at a dishonest task that could be accomplished honestly in comparative ease.

This trickery will set back the growing popularity of utility exhibitions no more than one old maid mite; however, it should be promptly coal-oiled.

To start with, let's get out the kerosene can, and take the potato off its nozzle by asking, Is it not a mistake anyway to associate large combs and wattles with high production?

The rather small 'non-freeze' combs bred on our own Anconas have had no calamitous result on the egg-record, has affected it not at all in fact. A friend of ours who has large flocks of high producing Leghorns, trapnested for years has long ago bred the big comb out of his strain.

Entering the Poultry Business

There are three ways of entering the poultry business, either of which has advantages and some disadvantages.

The first is by purchasing adult stock as a foundation, and this is perhaps the most satisfactory method, as one can see just what he is getting for his money, and it also assures fresh eggs for setting just at the time they are desired. Also the work of caring for the old fowls affords the beginner the opportunity of gaining a little knowledge and experience before taking up the more exacting work of caring for the baby chicks. This, however, is the most expensive method, as matured stock of the right quality cannot be purchased cheaply.

The second method is to purchase eggs and hatch the foundation stock therefrom. This is a very satisfactory way, proving one deals with a reliable breeder, one who will furnish fertile eggs of the desired quality, as it enables one to get into the business with a much smaller outlay of cash than by purchasing matured stock. Oftentimes several chicks are hatched from a setting of eggs any one of which will, when matured, sell for as much as was paid for all the eggs. Thus the difference in the expense of purchasing eggs and of purchasing stock becomes quite apparent. But in starting this way the beginner assumes the risk of a poor hatch resulting from causes over which the seller of the eggs has no control.

Purchasing day-old chicks is the third way of making the start, and the advantages claimed for this method are that it eliminates the work of hatching the chicks, also the possibility of a poor hatch, thus enabling the chicks to be counted before they are hatched, as the saying is. But to the writer this seems the least desirable way to begin, as the disadvantages of this method seem much greater than those of either of the other two methods.

The hardships to which chicks are exposed during long shipments across the country such as overheating and chilling temperatures and all manner of rough handling certainly are not conducive to their health and vitality, and chicks subjected to such abuse are not getting a fair start in life. A chick needs quietness and sleep during the first two or three days of its life, not constant disturbance, varying temperatures and rough handling. It is possible to pack eggs in such a way that they are protected from sudden changes of temperature and are not seriously injured by a considerable amount of improper handling, but chicks cannot be shipped in the same way that eggs are.

Another drawback to this way of obtaining the foundation stock is that those who sell day-old chicks usually are not breeders, but buy the eggs from which the chicks they sell are hatched wherever they can, the result being chicks of very common quality. However, if a real breeder who sells baby chicks can be located, and if the distance the chicks will have to be shipped is not more than one hundred miles, this method will prove fairly satisfactory for one who would rather pay someone else to do his hatching for him than to do it himself.

Regardless of the method employed in starting the business, the beginning should be a small one. If one prefers to start with adult fowls only one pen, four females and a male, should be purchased, and they should be of the best quality that one can afford to buy. If it seems more advisable to purchase eggs, three settings, and not three hundred, will be about the correct number to buy, being sure that they are of good quality, and purchased from a breeder who is willing to give assurance of fertility. Should one elect to begin with day-old chicks, twenty-five will be a sufficient number for one who has had no experience to care for, and they should come from a breeding establishment, and not from a huckstering institution.

There are two important points which should not be overlooked by the beginner with poultry: first, competition is so strong in the poultry business that it is unwise to begin with stock that is not at least of good average quality; second, plunging methods or "starting big" has never paid.

Mo.

JOHN MIULER.

ROBADIL ORPINGTONS

Have won more points in Madison Square Garden during the past four years than any other variety of poultry exhibited by any one breeder.

Robadil White Orpingtons were the winners of the first Madison Square Garden cup offered for the leading variety of poultry, which had to be won three times.

Robadil's first young pen of White Orpingtons, Madison Square Garden, 1922, also won the Crawford Memorial Cup, which without doubt is the most valuable cup ever offered in any show in America. This massive silver loving cup, designed on Grecian lines, was manufactured by Tiffany & Co., and is 12 inches high and weighs about 72 ounces. It was offered by the Garden Show in memory of Henry V. Crawford, formerly Mayor of Montclair, New Jersey, who was secretary and builder of the Madison Square Garden Poultry Show for many years.

The permanency of the Woolworth Building in New York is dependent upon the foundation. Equally the success of the Standard Oil Company is dependent on a sound fundamental principle.

If you do not start right in the breeding of poultry you cannot expect to attain the success you desire.

There is not a flock of good Orpingtons in America which does not contain Robadil blood.

If you desire the best there is, in Orpingtons, you must have ROBADIL strain.

Write for information and prices.

Exploiting the Humble Hen

By A. J. BRADLEY

Into the life of nearly every city and small town man there comes a time when he falls a victim to that insidious malady known as hen fever. It may come early in life, or it may come in his declining years, but the earlier it comes and is cured, like certain juvenile afflictions, the more assurance the victim will have that he is immune for the future. The man who has successfully withstood one attack is reasonably certain to be immune for the remainder of his days. The disease never strikes the one subject more than once.

Along about spring, when the traces of winter are disappearing and signs of sarsaparilla and real estate agents dot the suburbs, together with seed catalogues in the mail box, come the first signs of the approach of the hen fever. It is a deceptive time of the year, when nothing assumes its true perspective and values are distorted. The city dweller, wearied of paying from 90 cents to \$1.10 a dozen for eggs of doubtful vintage, and being forced to be content with chicken on the dining room table about once a month, owing to prohibitive prices, readily falls a victim to the germs of the hen malady.

The commonest forms in which these germs appear are in the advertising columns of the metropolitan Sunday newspapers. One would naturally suppose that the exploitation of the lowly biddy would occur in the columns of the agricultural press, but such is not the case. To those who are not versed in the ethics of advertising it would appear like a waste of money to advertise poultry and poultry supplies in a newspaper that circulates chiefly where bricks and mortar and poultry supplies in a newspaper that glance like throwing money away, about as futile as for a Fifth avenue milliner to advertise in the Hickory Corners Gazette \$45 and \$50 hats by parcel post.

The average farmer and the poultryman who depends upon his flocks for his living is too sophisticated to pay much attention to the literature that is fed to the credulous readers of the Sunday poultry pages. He gets his information direct from the high-priced experts of the agricultural colleges and the United States department of agriculture at Washington.

I began my work as a poultry editor in the office of a morning newspaper in one of the fair-sized cities of interior Pennsylvania. While I was employed in the composing room of that newspaper I kept a few chickens in a back lot, which were fed principally on table scraps, and more than paid their way. The managing editor overheard me one day telling of the merits of back-lot poultry keeping to my fellow-workers, and he suggested that I run a poultry column every Saturday for the benefit of the rural readers and the town lot fanciers. I told him my experience as a poultry man was limited to keeping a flock in a back yard, and I was not competent to advise farmers about their poultry when they knew more about the subject than I did.

"It's easy to get away with it, I'm sure," said the managing editor. "All you have to do is to spread heavily on the profits to be made from poultry and to write up some of the poultry plants near the city. The poultry supply dealers are heavy advertisers and we can get a good revenue from this feature. You ought to be able to get half a column of advertising to start off with, and we will pay you \$5 a column for your stuff. Go to it and see what you can do."

With very meager equipment as a poultry writer I began to edit a chicken column in the daily press. I took my own experiences as a back-lot hen man and wrote about them. I wrote lurid word pictures of the profit and pleasure to be obtained from keeping a few hens, and dilated upon the profits—never less than \$3 a hen—which the average town dweller could make by keeping from a dozen to 50 hens. I painted the rosy side of poultry keeping in those early days, partly because I knew no other side and partly because the managing editor would not stand for any exposure of the pitfalls which beset the amateur who ventures into the uncertain hazards of poultry keeping.

I made many mistakes in my first editorial venture. The managing editor had a series of cuts of the various breeds, and one was run every week, with a description. One week I ran the write-up for a "Brown Orpington" hen with a cut of a Rhode Island Red show winner. I got away with it the following week by claiming it was due to an error of the composing room. After that I bought a copy of the

THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

American Standard and was pretty safe in not mixing up the breeds.

I mingled with the poultrymen of that section and attended the neighboring shows and in that way acquired a superficial knowledge of the poultry game.

It was not until the readers of the paper began to bombard me with questions about the ailments of their flocks that my troubles really began. From my personal experience I knew there were such things as lice and gapes and that cleanliness was paramount in poultry success, but for the wide range of ailments that afflict the feathered race I was as ignorant as a prohibition enforcement officer of stills in a coal region town. I always tried "to play it safe" in my answers to subscribers. There were so many poultry diseases, I found, and the symptoms were so similar, that it was hard to diagnose whether the ailing bird had roup or white diarrhea. I generally advised the use of some of the remedies advertised in the columns of the newspaper. In that way I pleased the advertiser and the managing editor.

In those days I always saw to it that a period of about three weeks elapsed from the time in which I received the inquiry for medical advice until it appeared in the paper. I figured that during the interval the sick bird was either dead or better, and in either case the remedy I suggested was not needed.

After about a year with this newspaper I was offered the poultry editorship of a Philadelphia newspaper at a much bigger salary. Here was a chance of a much larger field, I argued, and an opportunity to get into the poultry game on an extensive scale. It was also my introduction to the "big poultry business," and many of the little ones, and the many failures which attended the expectation of sure and easy money from the perverse hen.

I found the work in the big city pretty much the same as in the smaller one. It was a game of playing the man who had visions of a life of ease from a few hens for the benefit of the dealer in poultry supplies and the suburban real estate men. The sole aim of the articles in the Sunday edition was to lead these people to believe that the poultry business is one of the simplest and most lucrative. Many who can ill afford to hazard the savings of a lifetime in an uncertain game like the poultry business are led by the stories of large profits to rush headlong into an unknown field of endeavor with little capital and no experience.

"Boost the 'back to the land' and 'a little land and a living' movement," said the managing editor of the big newspaper. "It gets us subscribers who are interested in having a home in the suburbs some day, and it also aids the dealers in real estate and poultry supplies. Give it to 'em strong! Besides, you know the bankers who are back of this sheet are also owners of the rapid transit line and want to build up the suburbs."

My work as editor of the poultry section of that newspaper took me to many plants in the vicinity of the city. One fact that impressed me was that nearly all of the owners were desirous of selling out and would be willing to sell for a fraction of what they had expended. They had entered into the ventures with high hopes and the expectation of large profits and an easy living. Neither was realized. Many of the extensive plants were owned by men of wealth, who either conducted the place as a hobby or kept it for the purpose of "ma-rooming" an idle son or other relative who was safer away from the bright lights.

During the time that I was engaged in editing a poultry page for the big daily numerous "systems" were brought to the fore with much heralding as the discoveries that would revolutionize the poultry business. As a rule these enterprises and "secrets" were based on the intensive system of poultry keeping. Carefully worded literature that was sent broadcast by the thousands proclaimed these discoveries as the panacea for the ills that beset the commercial poultry business, and gave the beginner the idea that they were the Aladdin's lamp that would banish forever the hard work and drudgery and failures from poultry keeping.

After an interval of ten years I do not recall any of these "systems" or discoveries that are in existence at this time. The poultry industry has made great strides during this time, but it has been along legitimate lines. Probably the numerous failures that were made through the adoption of these so-called short cuts to poultry success are too recent to enable any promoter to start them up again with any hope of success.

In those days the printed matter sent out by the inventors or discoverers of these

Fishel's World's Best and Egg-A-Day White Wyandottes

Have won at the leading Expositions, Shows and Fairs for the past thirty years. Just recently winning 1-3-4 Cock, 1-2-3-5 Hen, 1-2 Cockerel, 1-2 Pullet, 1-2-3-4 Pen, as well as Special Best Display and Best Pen in Show at the TENNESSEE STATE FAIR, NASHVILLE, TENNESSEE, Sept. 16-23, 1922. This unequalled winning proves that they still maintain their wonderful Exhibition qualities.

But the important factor is that FISHEL'S EGG-A-DAY heavy laying WHITE WYANDOTTES was the first strain on the continent to be bred for heavy trap nest Egg Records and Meat Producing qualities. Years ago we were censured for it, but always contended that regardless of how good an Exhibition Specimen we had, that it should have Utility Requirements. These years of Careful Breeding for both Exhibition and Egg Production makes them

AMERICA'S GREATEST EXHIBITION AND EGG PRODUCING FOWLS.

So send to headquarters, if you want the Best in Wyandottes, the Oldest Winning Strain, The Oldest Trap Nest Record Strain, with blood lines and breeding qualities that it is impossible to secure elsewhere at any price.

Send for Catalogue and Our Special Bargain Folder for this month—full of bargains. We are now booking orders for EGGS FOR HATCHING, BABY AND SIX WEEKS OLD CHICKS for early Spring Delivery. Let us know your wants and give us the opportunity to show you the meaning of Fishel's Fairness. We are the oldest Established Breeders of White Wyandottes; with the strongest and purest blood lines, and are in position to give you values no other breeder can equal.

TRY This Canopy-Brooder 10 Days At Our Risk

Yes, sir! Just to prove to you that the NO-COLD BROODER STOVE is the best canopy brooder on the market, we will let you try it on your own little chicks for 10 days at our risk. Then if you don't say it's the best you ever saw at any price, ship it back to us and you won't be out one cent.

The No-Cold Brooder Stove Guaranteed to Satisfy

The burner of the "No-Cold" is wickless. It starts on oil and burns oil with a steady, hot blue flame. No smoke. No soot. No coal to carry. You start it and then you can forget about it. Entirely automatic in operation. Our Special Oil Controller keeps the temperature constant, day or night. Can't go out. Can't overflow. Can't overheat. Average oil consumption of only 1 gallon every 48 hours.

Send for our free catalog folder and special 10-day Free Trial Offer, before you buy. Postal brings complete information. Write for it today.

THE MAGIC COAL BURNING BROODER

When you buy a brooder, look for quality and not price. The Magic has been tried out alongside of numerous makes and found to be a superior brooder. It holds the fire on a cold, windy night, which is due to the top and bottom automatic draft. This feature is patented and you will not find it on the ordinary brooder.

It is not necessary to take chances with your broods when you can buy a Magic, as it insures success. It has a large coal magazine, gas escape system, large ash door, galv. steel ash pan, etc.

They need attention only twice a day and no worry. Will gladly refund money after thirty days trial if brooder does not do all we claim. Send for free catalogue describing the Magic brooder together with plans for colony and laying houses. Live agents wanted in territory not taken.

systems teemed with the idea that any one could produce feed at 10 cents a bushel, secure an average yield of 200 eggs from each hen, and make anywhere from \$1,000 upward a year from a lot about 40 by 60 feet, while working at one's usual occupation. These boom prospectuses gave the poultry business the worst black eye it ever received, and the Sunday editions of the big city newspapers were the leaders in boosting the game of these promoters. The reputable journals and the farm papers ridiculed the claims of the "system" advocates, but their cautions did not reach the eyes of the inexperienced people who were misled by the glittering promises held out by these advertisers.

Unfortunately, many of the failures in the poultry business are not borne by people who can afford the monetary loss. I have known many city men who were induced to go into the poultry business through reading of the large profits and the easy road to competence in the business which the city newspapers play up so strongly. The very fact that an investment of several thousand dollars is required to start such a venture eliminates the man without some capital. I have known people who sold their property and business in the city and engaged in poultry farming without experience, and have met with the inevitable result—failure.

The poultry business is a big one, but it is composed of small units, and the income from a number of farm flocks seems trifling. To the man or woman who is accustomed to receive his or her pay at the end of the week the income from a small flock, marketed in the shape of a few dozen eggs, appears insignificant. Many beginners go into the poultry business with their aim set too high. They have heard of plants of 1,000 hens where one man takes care of the entire flock, and they at once figure an income of from \$2 to \$3 a hen. This runs into big figures, and the beginner is carried away with the possibilities of a big flock.

Getting the flock up to 1,000 hens is what tests the patience and perseverance of the beginner. The man who leaps into the poultry business on a big scale might just as well admit failure at the outset. He does not take into account the many details which have to be looked after before poultry keeping on a large scale is successful.

On the other hand, the beginner who enters the poultry business in a small way and endeavors to build his plant to 1,000-hen capacity in three or four years usually lacks the staying qualities necessary for such piddling progress toward the goal.

During the time I occupied a desk on a big newspaper I was often the recipient of letters from city men who had seen a bright and prosperous future in the poultry business after reading many of my articles, and who had invested all their money in it, only to find, after a few years' experience, that it is just as necessary to know the poultry business before entering into it as any other enterprise. It may be that these men blamed me for inducing them to embark in a hazardous business, ill prepared, but these same men would laugh at any one from the country who would think of coming to the city and engaging in their own particular line of work without previous experience.

I have received hundreds of letters from readers of the newspapers about the most profitable breed of fowls, the number of hens one man could profitably care for and the amount of money required to start in the business, but seldom did the seekers after poultry knowledge give a hint as to their qualifications to conduct a poultry business. From many of the inquiries received it was only too plain that the writers had been failures at about everything else, yet one and all were obsessed with the idea that if they could only acquire a poultry plant the way would be made clear for a life of ease and happiness.

Probably they were imbued with the belief that any one can succeed with poultry. I must confess that I have done my share in the past in furthering that idea.

As a more or less veracious writer of poultry literature for the press, I would have been only too happy to have said of all the people who had read my articles that they moved from the city to a poultry farm and lived happily and successfully ever after. I cannot do so. Their failures may be traced from first to last to a lack of knowledge and experience and capital. Far too many are impelled to enter the business by the alluring promises by some sharper who has evolved a new scheme of egg production, while others become tired of the continual grind of the cities and the daily punching of a time clock and are led to believe that the hen will solve the problem of a life of idyllic ease for them.

Warmth, Moisture and Air in Incubation

(Continued from page 1106)

by evaporation and out of it by condensation. The writer having devoted about 15 years to the subject of air conditioning in almost every industry has developed devices to handle the problem in various ways. The importance of humidity in enclosed spaces where people live, or work is so apparent today that almost all states have passed laws governing the amount of heat and moisture to be supplied to school rooms, etc.

Many industries owe their existence to humidity. The old weavers of England brought their looms to the valleys because it was conceded that damp places were beneficial to the weaving of cloth. Today a textile plant may locate anywhere convenient to its source of raw material supply and best transportation facilities. For today we manufacture humidity for them. This is accomplished in enormous water forcing machines, the moisture-laden air from which is blown to the various rooms throughout the plant. Different percentages of humidity are required for different rooms, such as for spinning, throwing, looming, carding, etc., and the amount of relative humidity and degree of temperature may be controlled by automatic instruments.

As you look about, almost everything you see and even wear has been through some form of drying. Today we use moist air to dry things. The veneer and woodwork of your furniture and house were treated in a dry kiln which operates with a very high moisture content. Should we use just dry air, and no moisture, we would dry the outside of the lumber so quickly before we began to reach the sap inside that we would get what lumbermen call case hardening, the lumber would split, bulge and twist itself out of shape and be worthless for manufacturing purposes.

To make things dry we surround them with moist air which will dry them uniformly and quickly. The drying of rubber is done with a very high humidity and rapid air movement. Suppose you were to try to dry a lump of raw para rubber without moisture. You would very quickly dry an outer crust or cake and never reach the moisture in the center, so it is with incubating an egg, which in one sense is a drying operation for 21 days. The dead-in-the-shell chick is the result of high temperature drying or hardening the lime of the shell as well as the membrane just within the shell, and embryo chick suffering within the shell from lack of ventilation because the porosity of the shell has been destroyed by drying, is weak in vitality and unable to burst its way out of the tough shell itself. In the process of natural incubation some moisture is evaporated out of the egg. The fresh egg is almost 65% water and nature has provided a sufficient water content to allow for some evaporation, but to bring about this evaporation without drying the shell or membrane of the egg is to apply warm air that contains sufficient moisture. Then the egg will dry down uniformly throughout. In order to measure the amount of moisture in the air of the egg chamber of your incubator use a hygrometer which can be purchased from any company selling thermometers.

Amount of Humidity Required for Incubation

Artificial incubation to be at all successful must duplicate nature's methods exactly as nature does it herself. With a hen on an earth nest, it was found that the nest showed 71% relative humidity the rate of evaporation from the eggs being 9.6% yielding good healthy robust chicks. A hen setting on a straw nest showed a relative humidity of 53% and the rate of evaporation was 12%. You will note that the evaporation was greater in the straw nest because straw being very dry was absorbing some of the moisture, lowering the percentage of relative humidity to 53 while the earth nest showed 71%, the earth itself not being dry and allowing the moisture from the hens body to surround her eggs.

Incubation requires 21 days with chicken eggs and during this time we may secure splendidly incubated eggs by maintaining an average of 60% relative humidity. This high humidity which the nature of incubation demands, further assists all the eggs in being uniformly warmed all over, the protective

Hatch More Chicks!

You can do your own hatching easier and better—
or make big profits hatching for others—with the new
1000-egg AUTOMATIC.

There is an AUTOMATIC Incubator to fit every sized hatching need. The MAMMOTH Junior Portable (illustrated below) has a capacity of 1,000 eggs—large enough to be a real "mammoth," small enough to appeal to everyone who wants to produce chicks in quantities. Its construction is the best throughout—it embodies our well known AUTOMATIC construction and is priced right. Especially fine for community hatcheries, giving you a flexible capacity with 1 to 20 machines. Now is the time to investigate. Get ready for next season. Send for our free catalog today.

Greatest Book on Feeds and Feeding Ever Published

If you need more money, if you want to make your hens lay more eggs this winter than ever before; if you want to learn about the most successful feeding methods for poultry of all ages, ascertained after years of experimenting on the part of our best breeders and poultry experts; the best feeding formulas used by the leading agricultural colleges in America; a formula for a standard egg producer that will turn any kind of hens, old, young, mongrels or purebreds into veritable egg machines; and a great mass of other valuable information on feeds and feeding—then you must have a copy of the "World's Foremost Poultry Feeding Secrets."

The one chapter giving a recipe for the Standard Egg Producer is alone worth many times a dollar, what the book sold for last season.

50 Scrub Gulls Produce 35 Eggs Per Day

To ascertain the effectiveness of the Standard Egg Producer the Standard Poultry Company of San Antonio, Texas, purchased fifty very low class mongrels, ages 2 to 4 years. The hens looked as though egg production were an impossibility with them. "When we began feeding Standard Egg Producer," reports the Standard Poultry Co., "they were not laying—not even one egg a day. In eighteen days after feeding them the Egg Producer they began laying, and at the end of six weeks, their daily average was 35 eggs. They held this high average until we sold them, several months later. We have tested the egg producer with purebreds and with mongrels and in every case it produced a surprising increase in egg production." Illustration shows actual results before and after feeding Standard Egg Producer.

Standard Egg Producer Makes Any Class of Hens Lay in Any Season

The Standard Egg Producer is a respecter of no class of hens or seasons of the year. It will make scrubs lay in the winter just the same as purebreds in the spring. If used in connection with artificial light, the high egg yield would almost stagger the most skeptical.

Western Poultry Journal

Published monthly, 50c year; 3 years, \$1.00. The magazine is so good that every reader of this paper will want it. Contains exact information the practical every day poultry raiser and beginner is hungry for but which is so often sadly lacking. Practical and scientific poultry experts guide you through every step in poultry raising from egg to show-room or market. The book and magazine should help you make a wonderful success. garment against draft and chill which we noted with our own comfort earlier in this article.

How can we secure 60% relative humidity in an incubator? Never! by putting in a pan of water or a wet sand tray. It is this problem to which the writer has devoted about 7 years of careful study, purchasing incubators, building them and finally discarding all methods of capillary vaporization as being inadequate. None of my early attempts would yield over 40% relative humidity constantly in the egg chamber.

Suppose you place into an incubator a pan the full size of the incubator and say that the water in this pan is $\frac{1}{8}$ or $\frac{1}{4}$ inch deep, how much humidity do you suppose you will have in your machine? Not over 30%. Water boils at 212°F. as hatching temperature is 103°F. and the pan with a solid mass of water must give vapor to the air, which can only occur as the air at 103°F. striking this water has time to vaporize it. Therefore in order to secure 60% humidity we will have to resort to some means of forcing it. Having secured this means we must control it for we do not want 100% or full saturation, so we must devise regulation means responsive to changes in relative humidity just as we now have means to control the temperature to a uniform 103°F. throughout the hatch.

How is relative humidity measured to know what moisture percent we have in the incubation chamber? This is done most commonly by a hygrometer. Scientists, engineers and U. S. Weather Bureau use another type, called psychrometer, which is the most accurate device.

Too much stress cannot be laid upon the absolute accuracy of all incubator thermometers. As incubator thermometers usually have an easily readable line at 103°F. so has the wet bulb incubator hygrometer an easily readable scale which requires no chart to give you at once the percentage of relative humidity as it is plainly marked in percentage of relative humidity, but only for the hatching temperature of 103°F. which must be maintained.

I am disposed to think that in an incubator with stagnant air the reading of the hygrometer is not as valuable, since it is not accurate, and a means must be found for circulating the air around the bulbs to get a dependable reading.

Air Circulation

Ventilation is the element that makes effective both temperature and moisture.

Ventilation or air circulation or air movement are coming in for more and more study, and theatres, restaurants, office buildings, etc. are spending thousands of dollars for ventilation. There is only one practical means of accomplishing this, that is by means of a fan the proper selection of which is governed by the requirements of the area to be handled. As heat and humidity are being supplied to the incubator the air should be kept in constant circulation. This air movement circulating throughout the entire egg chamber keeps all the eggs uniformly warm all over. The proper percentage of humidity in this air should be carried in circulation to evenly take up the moisture given off by the egg during its 21 days of being slowly and evenly dried down, and not quickly baking the shell, like a brick and lowering the vitality of the germ inside.

In a 100-egg machine the moisture loss should be 10 ounces in weight for each 6 days of incubation. Vapor pressure generating within the egg and carbon dioxide given off by the eggs as the hatch progresses lend themselves entirely to air circulation.

In conducting my experiments, I have worked with both hot water and hot air, but the water retains its heat longer than the air. If you heat a cubic foot of water to 103 degrees F. and a cubic foot of air to the same temperature the water will remain warm the longer. Indeed, since air cools rapidly, it must be heated to a higher temperature in the lamp in order to maintain the proper temperature in the machine. As a heating medium I used electricity simply for convenience.

Because of air circulation and vaporizing, I found little need for taking eggs out and

Progressive Poultrymen the World Over VACCINATE For Prevention and Treatment of Roup and Other Similar Diseases.

Leading Poultrymen of
the U. S. and 18 Foreign
Countries Discover Remarkable Re-
sults of Vaccination.

A product must have more than ordinary merit when it is used by leading poultrymen throughout the United States, and in Canada, Mexico, British Honduras, British West Indies, Chile, Colombia, Japan, New Zealand, Spain, France, England, Italy, Belgium, Netherlands, Philippines, Hawaii, Porto Rico, and Cuba. These poultrymen KNOW that vaccination by the "A. S. L. method" prevents disease, reduces losses to a minimum, and saves a large percentage of birds already infected with

**Roup, Chicken Pox, Diphtheria, Canker,
Colds, Catarrh, Cholera, Etc.**

Veterinary License No. 165, issued by the U. S. Department of Agriculture, under which A. S. L. Avian Mixed Bacterin is produced by the American Scientific Laboratories, Inc., Chicago, Ill.

You, too, can have a healthy, money-making flock if you vaccinate now. Your fowls are thus assured immunity to these diseases up to a year. Should they already be sick, a remarkably high percentage recover. Vaccination with

The Original A. S. L. Avian Mixed Bacterin

is the logical and scientific method of controlling these diseases. It is safe and inexpensive. It has produced satisfactory results for thousands of others. It will do the same for you.

Order A. S. L. Avian Mixed Bacterin direct from this ad. It is put up in three convenient sizes: 60 doses, \$2; 250 doses, \$5; 500 doses, \$7.50; Syringe and Needles, \$1.50 postpaid, with full instructions. Properly stored, A. S. L. Bacterin will retain its potency two years from date of manufacture.

Vaccination Pays--Read the Proof

"SAVED EVERY BIRD"

Lebanon, Ky., Feb. 17, 1922.

"I can highly recommend A. S. L. Avian Mixed Bacterin. When our chickens went off with roup, we were getting 40 eggs a day. I bought some of the medicine I had used for years and treated them. Some got well, but others took sick, and we lost enough to pay many times over the cost of the bacterin. Egg production dropped to 6 eggs daily. We saw your ad; ordered the bacterin, and started treatment. Not a bird has been lost since, and in less than a week the flock was laying 40 eggs per day again."

Mrs. W. L. Harrison & Son.

"NOT A SINGLE CASE OF DISEASE"

Hillsboro, O., Apr. 6, 1922.

"Last autumn we vaccinated all our breeding birds with A. S. L. Bacterin, and have not had a single case of Roup, Diphtheria, or Cholera this season. Our eggs hatched better than ever before; and we have had the best chicks ever obtained. We cannot afford to raise poultry without A. S. L. products, which we are very glad to recommend. Now we advertise immunized stock only."

GALLI-CURA

Galli-Cura is a real preventive and treatment for White Diarrhoea and other bowel diseases. Used with satisfaction by thousands of poultrymen.

\$1.00 a package
postpaid.

FREE-- New customers ordering both syringe and bacterin (any size) will be given FREE a \$1.00 package of Galli-Cura.

Silver Campines

Green Sheen Strain

I HAVE 400 Campines, 1922 hatch. The oldest pullets are now mature and laying and the cockerels are strong and lusty. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have

been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

FRANK E. HERING Desk B SOUTH BEND, IND.

"LADY BEAUTIFUL"

Pullet Line Only

Barred Plymouth Rocks

Lady Beautiful birds won at Chicago Coliseum, Dec., 1921; 1-2 exhibition hens; 5th exhibition pullet; 1-5 pullet-bred cock; 2-3 pullet-bred cockerel. At Baltimore, same week, in a grand class of Barred Rocks, the best that Baltimore has ever had, as follows: 1-2-3-4 exhibition hens; 1-2-3-5 exhibition pullets; 1-2 pullet-bred cocks; 1-2 pullet-bred cockerels. STOCK—Always some choice pullet-bred males for disposal to the discriminating purchaser.

cooling them, so eggs can be turned mechanically.

[Note: The article by Mr. Faber emphasizes the important points of temperature, moisture and adequate ventilation in relation to incubation. Temperature is today well under control. A vaporizing fan, such as is used in cigar case, to humidify the air, suggests itself upon reading Mr. Faber's article. The value of moisture in the air has perhaps never been more vividly explained. It is known by cooks that if they bake bread in a dry oven they get a hard crust but if they introduce into the oven a pan of water, they get a thin, soft crust, and the bread bakes just as thoroughly.]

The feathers of the hen are an effective insulator and when the hen sits on the moist ground, her warm body draws up moisture so that it surrounds the eggs, but the plumage appears to confine both the warmth and moisture within the nest with insignificant circulation of outside air. On this and other points, Mr. Faber's article should stimulate new interest.—F. L. P.]

Cold Climate Poultry House

The following plans are for a colony house used with success on the farm of Charles Lewis, Springfield, Maine. It is a curtain front house used for fifty laying hens. It is built on skids of six by eight inch lumber.

The sills are four by four, cornered together and rest on the skids. The studs, plate, and rafters are of two by four spiked together and reinforced at the corners. The roof is of unequal span, the ridge being six feet from the front and ten from the rear.

The floor is double-boarded. The first floor is of hemlock boards covered with paper. The top floor is of matched flooring, as is also the walls. The whole outside surface is shingled.

At each end of the front of the house, an ordinary storm window is screwed on, extending from the plate down. Between these two windows is an opening three feet deep, which is covered with burlap on cold nights and in winter.

The bill of material used by Mr. Lewis follows—

2 Pieces 4"x4"x12' (sills).

Colony House—Exterior View

2 Pieces 4"x4"x16' (sills).

9 Pieces 2"x4"x12' floor joists, plates, dropping board.

10 Pieces 2"x4"x18' rafters and studs.

4 Pieces 2"x4"x12' studs, back, sides and front.

2 Pieces 2"x4"x14' studs, back, sides and front.

3 Pieces 2"x4"x12' studs, back, sides and front.

3 Pieces 2"x3"x12' roosts.

420 feet matched boards for flooring.

600 feet boards for walls, roof, etc.

2 skids 6"x8"x18'.

5 prs. hinges.

2 storm windows.

20 lbs. nails.

The dropping board is in the rear of the house, high enough from the floor to allow the birds to pass beneath. The perches are of two by three material on a frame hinged at the back to turn up when cleaning off the platform. These perches are eight inches above the dropping board.

Me.

Vinol Houghton.

U. S. Dept. of Agri. reports 5,723,000 cases of eggs, Nov. 1, 1922. Five year average 4,351,000 cases. Frozen eggs, Nov. 1, 30,531,000 lbs.; five year average, 19,051,000 lbs. Frozen poultry, 30,253,000 lbs. in refrigeration Nov. 1, 1922. Five year average, 39,053,000 lbs. From these figures it appears that the heavy pack of eggs is moving into trade channels, while the pack of poultry meat is nine million pounds below average holdings of past five years.

Chas. A. Cyphers

HATCH 'EM

IN A

Buffalo Incubator

the "Perfect Hatcher"

One Hatch Pays For One Incubator

Some of the largest hatcheries in the country started with a Buffalo Incubator. The sale of Day Old Chicks out of the first setting paid for this Perfect Hatcher. Then Profit.

One customer, starting with one No. 3 Buffalo in January, bought seven in the four months following, and not once did the first hatch fail to pay for the Buffalo. The following season he increased to twenty-two No. 3 Buffalos, buying two and three at a time, with uniform success in having each Buffalo pay for itself out of the first hatch.

You can do as well. The demand for good baby chicks was greater than the supply last season, and it will be this. Get into the game and make some of the easy money.

Increase your own flock with early hatched Buffalo pullets. Fresh hennery eggs will be wholesaling in New York at \$1.00 a dozen in January. There is no indication they will be less another year. Get your own early pullets—the fall and winter layers of high-priced eggs—then use your Buffalo Perfect Hatchers to supply some of the baby chick trade.

THE BUFFALO is the Perfect Hatcher because it has the two things necessary to successful incubation—diffusive heat and correct ventilation, producing that mellow warmth found only in Buffalo Incubators. The constant and uniform heat in this "perfect" machine is accomplished by my patented sensitive and accurate regulator. The regulator was patented by me in 1895, and has never been equalled, although much copied—my later improvements have increased its efficiency and ease of operation.

THE BUFFALO is built to last. You will not have to junk it in a year or two. My machines sold twenty-five years ago are still doing good work. Second-hand Buffalos are always in demand. They never wear out. Send your name and address and get free catalogue describing the many superior features of Buffalo Equipment. You'll find this season a profitable one if you decide to Hatch 'Em and Rear 'Em with Buffalo Equipment.

The Buffalo Coal Burning Brooder

is the one brooder that always gives satisfaction. In cold weather the high body or drum heats the room as well as beneath the hover. When the weather gets warm just slide the canopy up the drum another ten or twelve inches and the chicks are comfortable without checking the fire until it goes out. The Buffalo is not a toy brooder,—it is built for service in the coldest climates.

THE BUFFALO Never Out Oil Burning Brooder is in a class by itself—you can depend on it day in and day out—you need never worry lest your chicks burn up or freeze—they are safe with a Never Out under any condition where an oil burner can be used.

BUFFALO INCUBATOR COMPANY

KEELER'S White Wyandottes

"The Aristocrats of the Breed"

1st Exhibition Cockerel Chicago

matings so necessary in exhibition pairs, trios and pens of the successful breeding yard. In twenty years of exhibiting we have never failed to win 1st cockerel and 1st pen. In the last 14 years we have never failed to win more points than all competitors combined. We have never sold or shown a bird which we did not raise or breed.

Exhibition males \$15.00, \$25.00, \$35.00, \$50.00 and upward. Exhibition females \$15.00, \$25.00, \$35.00 and \$50.00 each. Exhibition pens \$50.00, \$75.00, \$100.00 and \$150.00.

The Rexall Strain (Standard bred-to-lay)

Is widely and favorably known because of their all the year round egg producing habits (200 to 288 eggs). Commercial poultrymen have found them especially adapted to winter egg production and are quite as enthusiastic over their merits as broilers. The 17 years' SUCCESS of this line recommends their adoption. Breeding stock \$5.00 and upwards according to individual merit and ancestral performance. A definite statement of your needs enables us to render satisfactory service. THE KEELER LINE WILL SUSTAIN OR ESTABLISH YOUR NAME IN WHITE WYANDOTTES.

CHAS. V. KEELER & SON

R. F. D. No. 11, - - WINAMAC, IND.

THE SUPER EXCELLENCE OF THE KEELER STRAIN is direct result of twenty-eight years following a definite program. Haphazard methods in breeding poultry are as Suicidal as going to sea without a chart. Anchor your faith in the Keeler Strain and steer straight to victory. The annual success of our customers at America's foremost shows lends argument to our claim,—"THE WORLD'S GREATEST STRAIN". This proof of their exhibition excellence in the hands of others supplies the measure with which to gauge your possibilities. YOU SELECT THE SHOW WE SUPPLY THE WINNERS.

1st Hen Bred-to-Lay Class
Chicago

ILLINOIS EGG LAYING COMPETITION

(Continued from page 1109)

have come in with "300 egg" strains, three month old pullets laying, and cockerels that crow when they are just hatched." I laid Mrs. Mahood's letter before A. D. Smith, head of the Advisory Board of the Illinois Egg Laying Contest. Thereupon Mr. Smith said:

"You ought to come to Quincy and see our layout and see what we are doing. We have two classes. I know the value of the larger breeds and that they are the popular type of chicken on the general farms of the middle west. From the beginning it has not been our intention to have these general purpose breeds compete with the highly specialized egg-type breeds. For that reason we have two separate and distinct groups, and in our monthly reports we list the egg yield of pens entered in the Mediterranean class; and then we list in another group, the production of the pens entered in the class composed of American and English breeds. Thus the Orpingtons, Wyandottes, Rocks and Reds compete among themselves, whilst the Leghorns and Anconas compete together."

It was interesting to learn that the Illinois contest did not have a prize for the highest laying bird, that is, that the breeds did not all compete together to produce a single champion. There is such a thing as meat value in poultry. The recent award of \$500 to John Chantry at the Harrisonburg, Va., meat poultry show, is practical testimony to the fact the Light Brahmas are still bred to full size in Illinois. To breed them to an egg schedule is to breed them to an egg-type Standard of size and shape and temperament. That means Leghornizing the breed, for the Leghorn's conformation is universally recognized as the truest expression of egg qualities.

The general market situation should make clear the fact that the dual-purpose breeds occupy a secure position in poultry culture. There is a substantial differential in prices in favor of heavy poultry. In Canada, a colony that is largely agricultural, and where the influences and effects of world conditions are felt sooner than in the United States where we have a very large consuming population, prices on poultry were quoted on Nov. 2, 1922, by Gunns, Toronto, as follows:

	Live	Dressed
Fowl, heavy, 5 lbs. and over...	16	20
Fowl, 4 to 5 lbs.....	12	16
Fowl, 3 to 4 lbs.....	7	11
Fowl, under 3 lbs.....	5	9

In the Quincy Contest Pens

Some of the smaller breeds that fail to make good in egg production, and molt early as a result of low vitality and a drying up of the egg processes, run down in flesh and come in the three pound class. On the other hand, the disposition of many of the specimens of the larger breeds in the Quincy contest houses, was plainly a disposition to put on flesh after the cessation of egg production. They were not the high layers, but were early molters that had become rather inactive and lazy, and were getting in prime shape as table poultry. There are thousands of such birds on the farms; they eat more feed than the lighter type, but they have greater table poultry qualities when consigned to market.

On the average farm, where, in the very nature of the farmer's business, grain growing is the first consideration, providing plentiful grain sup-

Halbach's White Plymouth Rocks

"The Proven Leaders"

Yes, this line has broken all records. At Chicago, 1920, 1921, 1922; Minnesota State Fair, 1921, and Wisconsin State Fair, 1920 and 1921, they won every prize and ribbon offered. Again at the Wisconsin State Fair, 1922, in strong competition, they won every FIRST and every SECOND. Also every ribbon in the Bred-to-lay class, as well as First and Third for best dozen brown eggs. No strain has such a wonderful combination of vigor, egg production and show quality. Are these not the features that you want? Our Fall Sales Sheet, telling about the greatest out and out bargains in true superior quality egg producers is free for the asking. Write us and tell us your wants. We can please you.

H. W. HALBACH & SONS

Place your order NOW For Early Hatched Chicks

FIRST HATCH READY FEBRUARY 12, 1923

The early chicks are the biggest money-makers. Pullets come into laying in August, September and October, when prices are very high. You will get a longer laying year and you can sell the cockerels as broilers for twice the price they will bring later.

LORD FARMS LEGHORNS are in greater demand than any other strain east of the Mississippi River. There is only one reason for this. They make money for their purchasers.

THE GROWTH OF LORD FARMS has been most remarkable—unparalleled by any other farm in the East or Middle West. Ten years ago we were selling about 15,000 chicks a year; in 1922 we sold about 400,000, **ALL ONE BREED—ALL ONE STRAIN**

WE ARE STANDARDIZING THE BABY CHICK BUSINESS: You can come back to Lord Farms year after year and buy your chicks with practically all the risks of big losses eliminated; you don't have to worry as to whether you are going to get good chicks or not. **YOU ARE ALWAYS GOING TO GET GOOD CHICKS FROM LORD FARMS.**

OUR BUSINESS HAS BEEN BUILT UP ON THE BASIS OF "DEPENDABILITY."

There are no ifs, ands, and buts—it is a plain fact that **IF YOU KNOW YOUR BUSINESS YOU ARE BOUND TO MAKE MONEY WITH LORD FARMS LEGHORNS**, the greatest dollars and cents strain of Leghorns in the East.

Every year sees a bigger demand for February hatch Leghorns. **TAKE OUR ADVICE** and split your order this year. Over a period of years we have found this combination to return the most dollars for the investment; get part of your chicks in February and early March, and the other half early in May.

*Get ready right now for a bunch of early chicks on
Lord Farms' Advice.*

HAROLD TOMPKINS RHODE ISLAND REDS

An Investment Not a Speculation

When you buy these Rhode Island Reds you know that you are getting direct descendants of Boston or Madison Square Garden prize winners which possess such perfect type and color that they will attract all good judges in every show. You also know that you are getting birds that have been bred from stock that has been selected for type, color and egg production for so many years that they will transmit these valuable qualities to their offspring. The achievements of this famous strain made each year have raised them to their foremost position and exhibitors and breeders all over the world are using them to strengthen their strings of show birds and improve their breeding stock. No matter what is required, birds to improve your type, strengthen your color or increase your egg production, Harold Tompkins Rhode Island Reds are a reliable investment that will pay.

Show Room Achievements in 1922

For years these birds have been heavy winners in the leading shows of the country but the height of their achievements were reached last year when they won at Boston and Madison Square 20 blue ribbons out of a possible 24 and 130 birds won prizes out of my total exhibit of 153. The greatest record ever known.

Customers Share My Success

Reports of satisfaction similar to the following are continually received which leads me to believe that you will be equally satisfied if you will place your order with me.

"My Dear Sir:

The cockerel came yesterday afternoon and I am so pleased I hardly know what to say. I thank you so much for selecting such a fine bird for me. Anything I can say in your favor I'll be glad to do it. Yours very truly."

"Portsmouth, Va., Nov. 2nd, 1922.

"Alexandria, Pa., Sept. 18th, 1922.

"Dear Sir:

"Well, that bird did the trick, took 1st cockerel and then finished up by taking best bird in show. I certainly was pleased. Got 3 nice cockerels out of that setting of eggs and have 6 nice pullets. Thanking you for past favors, Yours respy."

Business Methods

All birds are fully described and those above utility grade are shipped on approval. Every bird is exactly as represented and satisfaction guaranteed every customer. I make all selections personally and will be glad to give you the benefit of my experience. Grades and prices to suit everyone. Write at once.

Kent Barred Rocks

Bred for egg production and a long productive life. 1920-21 Storrs Contest high Rock pen and individual. 1921-22 Contests 2nd Rock pen at Storrs and Cornell, 1st at Quincy, Ill. 1922-23 Contests have pens at Storrs, Vineland, Michigan, and Quincy, Ill. Certified and Pedigreed Breeding Cockerels. Circulars.

KENT POULTRY FARM,

Cazenovia, N. Y.

plies for the live stock, including poultry, and on these average farms where the poultry usually receives average care and is cooped in an average sort of poultry house, the type of poultry that is most popular is the average layer that yields a good, heavy carcass rather than the average layer that ends the productive season with a small, thin carcass, a poor appetite and a nervous temperament.

There is a third type that seems to be found here and there in all the breeds. It is not the little, dried up three pound Leghorn hen, for which Gunn's in Toronto offer 15 cents for a whole live one. Nor is she the early molting, indolent, meat type. This third kind of hen is the one that makes the record of performance in the trap nest. She has big digestive capacity eats heartily, delays the process of molting in order to get in a full work year before the close of the contest on October 31st, and is usually characterized by shanks that are somewhat faded in color, by soft skin over her abdomen, a large, moist vent, and pubic bones that are rather thin, straight and pliable. As for size and weight of body, the following figures give data on seven of the best birds in the Quincy contest, both at the beginning and end of the contest.

	Eggs laid	Weight Nov. 1, 1921	Weight Oct. 30, 1922
W. Leghorn, pullet...	247	4 1/4 lbs.	4 1/2 lbs.
W. Leghorn, pullet...	205	3 1/4 lbs.	3 1/2 lbs.
Ancona, pullet	197	3 1/2 lbs.	3 1/2 lbs.
Black Minorca, plt...	207	5 3/4 lbs.	6 lbs.
Barred Rock, plt....	231	4 3/4 lbs.	6 lbs.
S. C. Red, plt.....	190	5 lbs.	6 lbs.
S. C. Red, plt.....	193	4 3/4 lbs.	5 lbs.

Other Record Hens

Since obtaining the above weights I learned that the high bird in the Storrs, Conn., contest was a Barred Rock from the Ontario Agricultural College that went 301 eggs, being the second three hundred egger out of 10,000 birds that have been put on test at Storrs. Under date of Nov. 9, 1922, Professor W. F. Kirkpatrick, in charge of the Storrs Contest, telegraphed me that this record breaker weighed 5 lbs., eleven ounces.

The egg records at Quincy, or even the high record at Storrs, are not equal to those made on the Pacific Coast. At the annual contest held by the California Farm Bureau at Santa Cruz, a White Leghorn hen made 324 eggs for the year now closed. At the contest held at the Western Washington Experiment Station, Puyallup, a White Leghorn, according to a press despatch of Oct. 31st, finished the year with 335 eggs, while ten other hens passed the 300 egg mark.

It is such reports as these that conjure up fanciful notions of the possibility of egg farming as a commercial enterprise. It should be fully understood that they are not all 300 egg hens, nor two hundred egg hens, that inhabit the very best of laying houses. The following statement, put out by the Storrs contest, Oct. 16th, is a practical statement of what can be expected in egg production under the best conditions and with properly selected birds:

"At the close of the fiftieth week of the laying contest at Storrs the hens had laid a grand total to date of more than 160,000 eggs or an average of 160 for each individual hen. This is just the number that the management

MAYSLAKE BUFF ORPINGTON FARM

Frank F. Conway, Owner Box A, Hinsdale, Illinois

Introducing Miller's Ideal Suburban Hatcher

HERE it is—the most practical and economical Hatcher ever offered to poultrymen. It is manufactured and sold exclusively by the J. W. Miller Company, famous throughout the Poultry Industry as manufacturers of Ideal, Mammoth and Standard Incubators and Brooders. Into the Ideal Suburban Hatcher goes the Miller experience of thirty-four years. This guarantees correctness of design and efficiency of operation.

Such an Incubator has long been needed. We have designed it to meet the requirements of poultrymen who want to hatch chicks in large numbers, yet do not have the room for Mammoth Incubators and do not wish to invest to the extent necessary for the purchase of a large machine.

Suburban Hatcher Built in Units

Each unit has a capacity of 400 eggs and is built in double and triple decks. This construction gives the double-deck a capacity of 800 eggs and the triple-deck 1200 eggs. Each unit has four egg trays and each tray holds 100 eggs.

Construction features include: High-grade California Redwood case—pure copper hot-water heating system—lamp stamped from one piece of steel and positively will not leak—two-wick, extra-heavy burner.

Write today—sure—for special illustrated circular containing complete descriptive information. You have probably hoped that some day an incubator like the Suburban Hatcher would be available. Here it is—backed by the Miller guarantee of quality that stands for the best that experience and a great modern factory can produce.

Special offer for early orders. Act now!

"DANDY" BONE CUTTER Only \$5.00 Down CLOVER CUTTERS, FEED AND GRAIN MILLS FOUR MONTHS TO PAY

Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood and feathers. Write for our free booklet and easy payment plan. We also sell on 15 days trial, no money in advance. The "Dandy" costs less than most bone-cutters and it works infinitely better. To insure big sales this year we have made special reductions in prices. Don't delay. Write now.

Stratton Mfg. Co., Dept. G. Erie, Pa.

of the contest figures that a perfectly good hen ought to lay in a year. This estimate is based on records collected over a period of years and it is known that 160 eggs is far above the production of the average farm hen. In other words whatever eggs are laid for the remaining two weeks of the contest will be pure velvet, so to speak."

The above was followed up by another statement by the Storrs' authorities, as follows:

"An enormous number of egg records collected at Storrs during the last dozen years form the basis for predicting the minimum production for a good pullet that is well fed and well cared for. The table below shows the number of eggs each hen in the flock should lay during each month of the year. Small flocks that have special care and attention can be made to do better, especially during the earlier months of the hen year. The total of 160 eggs offered as a standard or guide is admittedly more eggs than the average farm hen lays. On the other hand no real chicken man will be satisfied with less and many successful poultrymen in Connecticut are getting more.

"Number of eggs hens ought to lay.

"Total for the year—160 eggs."

High Average Production

In bringing out in bold relief in the mind of the new breeder only the extraordinary records of phenomenal birds the fact is easily overlooked that every flock comprises some mediocre birds which bring down the flock average. The poultryman's profits however, depend on flock production, and while high individual records are interesting, and may be valuable from a breeding standpoint, a profitable commercial egg business cannot be built on them alone.

In the Quincy contest for the year now closed, there was a White Leghorn pullet that laid 243 eggs. Her pen mates were hatched from the same setting of eggs. They laid during the year, 115, 79, 157 and 123 eggs respectively.

The high pen in the Mediterranean class had an individual in it that laid 247 eggs, but the pen mates brought up the tally by laying 175, 193, 227 and 231 eggs respectively. These also were White Leghorns.

In the American and English classes the high pen was composed of Barred Rocks which laid 177, 231, 165, 190, 148 eggs per bird. A White Wyandotte pen came second with individual records of 211, 168, 174, 148 and 133 eggs.

Broodiness

The larger breeds are often criticized because of their inclination to broodiness. In the Quincy contest there was a Buff Wyandotte hen that was broody 7 times yet laid 153 eggs. This satisfactory production was attributed to the fact that the hen was immediately broken up as soon as she showed signs of clucking.

The hens in the contest are broken from broodiness at the first symptoms, by being placed in the "jail," which is a slat coop at end of dropping board in each pen. This broody coop measures 30x30 inches. (See illustration of interior of house.) By the practice of this method, the hens are broken up from broodiness in 2 to 7 days.

In the contest pens there was a White Leghorn female of a big, strong

Here it is! Just what you have long been looking for — an oil burning hot blast heater for coal burning brooders that is safer, more dependable, easier to regulate, and much more economical than coal. Nothing like this has ever before been offered to poultry raisers — Sol-Hot has at last solved the problem of the coal burning brooder stove. Burns kerosene or will operate successfully with distillate which costs only 8 to 9 cents a gallon.

Don't Burn Coal

Fits Any Coal Burning Brooder Stove

Why burn expensive coal this season, with its dirt and ashes, trouble and constant attention, when a Hot-Air Blast Sol-Hot will heat your brooder stove better and cheaper and with scarcely any attention. It saves you hours of labor and Has Automatic Thermostatic Oil Control.

THE SOL-HOT HOT-AIR BLAST Burner has a special designed burner bowl with a central down draft which produces perfect combustion by distributing air uniformly to the flame. In the center of the bowl, directly underneath the air intake is the vapor generator. The vapor is delivered to the flame through a series of very small holes near the top of the generator; the flame burns at a distance from the holes so that carbon does not accumulate.

This New Hot-Air Blast Sol-Hot is the sensation of the season in Brooder Equipment — it is so perfect in operation—so simple in adjustment, so economical to operate that it sounds the knell forever for coal burning brooder stoves.

For COAL BURNING BROODER STOVES

A Hot Air Blast Oil Burning Heater
A Boon to Owners of Coal Burning Stoves

This New Sol-Hot Air Blast Heater is not an experiment — it has been thoroughly tried — tested and perfected. It produces perfect combustion, has wide range of adjustments, burns any size flame desired—makes more heat than coal.

Notice to Dealers

Don't stock up with Coal Burners—Our big advertising campaign explaining the superior merits of Sol-Hot Hot Air Blast Burners for Coal Stoves as well as the complete Sol-Hot Air Blast Brooders will create a big demand for them in your territory. You can have this business if you act quick. Write or wire for particulars.

For Those Who Do Not Have Coal Burning Brooder Stoves

but who are thinking of purchasing —can be thankful that SOL-HOT HOT-AIR BLAST CANOPY BROODER was announced before they spent their money. Investigate the Sol-Hot before buying a coal burning brooder.

Sol-Hot Hot-Air Blast Canopy Brooder takes the place of Coal Burning Brooders—it is a complete Brooder with the same burner that we furnish for coal burning stoves. Don't buy a coal burning Brooder now that you can get the New Sol-Hot Air Blast oil burning Brooder that will give you so much better service without the worry, constant work, dirt and trouble of Coal Burners. It comes to you complete, ready to operate. With the addition of this Hot Blast Brooder to the already famous Sol-Hot line of Canopy Brooders, we are able to furnish every poultry raiser, large or small, with the equipment best suited to his requirement. Read about Sol-Hot Canopy Brooders on the following two pages—also about our Multidek Sectional Incubator three pages over — the most complete and we believe without a doubt the best and most dependable poultry equipment on the market.

Coal Burning Brooder Stoves (7)

OVER 25,000 SOL-HOT HEATERS

Because They're Better

That's just why there was more Sol-Hot Brooder Heaters sold last year than all other heaters put together—they are better—they meet the requirements of the poultry raiser—they are dependable.

Twelve years ago H. M. Sheer designed and built the first oil burning stove for brooders and incubators ever produced. Although a very crude affair when compared with the New Improved Sol-Hot of today, yet it marked a new era in the poultry raising industry. From that day up to the present, although Sol-Hot has been copied and imitated, it is protected by patents, so that it has never been pushed out of its rightful place—at the head of the line of all Brooder and Incubator Heaters.

Each succeeding year has seen new improvements added—Sol-Hot has been simplified and improved until today it is without a doubt the most perfect Oil Burning Brooder Stove on the market. That's why over 25,000 poultry raisers chose Sol-Hot equipment last year.

With the new improvements added this season Sol-Hot will be more popular than ever—it is in a class by itself—years ahead of all others.

The New Improved Sol-Hot Is Made In 5 Different Sizes—a Proper Size for All Brooder and Incubator Requirements

For Brooders and Incubators

The New Improved Sol-Hot Heaters or Stoves are a "boon" to poultry raisers. All the objections, annoyances, worry, dangers, etc., so common in the old-style heaters have been absolutely overcome. It is the simplest, safest, most dependable, most satisfactory. It has no wicks to trim—no ashes—no soot—no smoke—no odor—no danger.

This season's improvement consisting of Double Oil Control—Just-rite Valve and Dial—Protecto Stove, makes the operation of the Sol-Hot so simple and safe that an eight year old child can operate it—it is as dependable as a clock. It is without doubt the most dependable Brooder and Incubator Heater ever offered to poultry raisers.

Sol-Hot Brooder Stoves are made in five different sizes—a proper size for all Brooder and, Incubator requirements. Don't buy brooder or incubator equipment until you send and get free folder catalog telling all about the many superior features* of Sol-Hot—the Heater that is years ahead of all others.

This "Add A Section" Idea Makes a **BIG HIT**

With Poultry Raisers

If you are planning hatches of from 220 eggs up to 1760, here is the machine that will just exactly meet your requirements—you can start with one section and add additional sections as you wish—you don't have to spend a lot of money to start—you can begin on just as small or large a scale as you wish, letting your incubator grow with your business.

The **MULTI-DEK** SECTIONAL

Sectional Incubator is the only one of its kind on the market—it was designed especially for the poultryman who wants to let his profits pay for his expanding business.

220 to 1760 Egg Capacity

From one to eight sections, each holding 220 eggs can all be heated with one heater. Each or any section can be operated independent of the others. The Multidek is designed and built correctly for perfect incubation—it will hatch every hatchable egg.

Automatic Egg Turning Tray

is a feature that is a very important one—it means a great saving in labor and insures accuracy in the turning of every egg at proper time.

You Can Have **HOT WATER** or **HOT AIR**

Multidek Sectional Incubators are made so that either hot air or hot water heating can be used—you have your choice. While some prefer hot water, others express a preference for hot air heating. Either one is equally effective—it's simply a question of choice.

We furnish the Multidek—any size you want—from one section up to eight. We ship you the lumber all cut, fitted, marked and ready to put together. Any one can set a section up ready to operate in a few minutes.

For the man who is handy with saw and hammer and would like to save money by building his own Multidek, we will furnish complete set of plans with measurements and complete working plans so that you can build it yourself.

Mail Coupon for Prices and **FREE** Illustrated Folder

Fill out and mail coupon and get free folder telling all about this practical economical incubator. Folder tells how Multidek is made—how it is heated—why it hatches better—also low prices. Write today.

type, that upon arrival weighed 4½ pounds as a pullet. She had a very large comb. She laid 92 eggs. A 3¾ lb. pullet upon arrival, with a small comb, laid 17 eggs during the year.

There are several birds that never deposited an egg during the year. We handled one of these. She had some of the outward signs of egg production, but was what is called "an internal layer." It was the trapnest that found her out.

Color of plumage does not appear to play a part in egg production. Some of the poorest colored Rhode Island Reds were the poorest layers. The two Red hens that laid 193 and 190 each, had attractive color, and at

are 10x12 inches. The trap is made of three pieces of galvanized iron, each piece 2¼ inches wide by 10 inches long. These pieces are hooked together with little spiral galvanized rings. The lower one of the three pieces is made a trifle heavy at the bottom by being bent over into a seam. In setting the trap, the bottom piece is folded upward, so that only two of the pieces hang down. When the hen enters the nest, she lifts the gate somewhat, and the bottom piece folds down over her back. The three-piece trap will not open out, so the hen is imprisoned until released. Attendants tend the traps every half hour. This reduces floor eggs to a minimum. Marketable eggs only are counted in the tabulations of the day. Pee-wees do not count.

The water is supplied in one gallon crocks which rest on a platform about 18 inches above the floor. There is about six inches of litter on the floor, so the crocks are up above the dirt by about one foot. The water platform is just a frame, with legs 24 inches long. (See illustration.) The water crocks are brushed out every morning with a heavy bristle brush, known as a painter's "duster."

The pens are each 16x16 ft. Five lots of five birds each, a total of 25 females, are kept in each pen. There appears to be less chance for favoritism when five entries are penned together. Last year one entry of five White Leghorns laid 107 eggs for the five birds, although among the other twenty birds in the pen were some of the best layers. If the 107 egg entry—21 eggs to the bird for the year—had been cooped separately the owner might have felt that surely the caretaker had a grudge against him or his birds.

The contest houses are of the semi-monitor type. (See illustration.) The houses are 5½ ft. high in front and run up to a height of 6½ ft. at center. Then comes the semi-monitor feature, which is 1½ ft. high. This makes the house 8 ft. from ground to peak. The rear is 5½ ft. high.

The windows in the semi-monitor are about 15 in. deep and 5 ft. long. There are two sets of windows to each pen. Each set of front windows comprise two sash and one curtain, which hangs up. The fronts are also covered with fine mesh wire, so that when the sash are lifted out in summer, and the curtain frame is hinged up, the opening will be protected.

The part of the house under the front section of the roof measures 6 ft. and is termed the scratching compartment, having a sand floor. The remainder of the house, 10 ft. deep, is covered with litter. In the back of the house is the dropping board, 30 in. wide and 16 ft. long. The roosts are not quite that long on account of the broody jail at the end. Two pieces, 2x3 inches, broad side up, form the roosts.

The litter is changed as often as it becomes broken up or has the least taint of mustiness. The mash is fed in hoppers, and is before the birds all the time. The chickens are never

KILL THEM ALL

Quickest acting, most devastating rat exterminator known—Rodene, now available on every farm.

Absolutely guaranteed on money-back basis by company of over 20 years' standing. No danger to livestock and poultry. Not a poison. Instead, it is a deadly disease germ, highly contagious, which attacks only rats, mice, gophers and other rodents. Farmers using Rodene say they do not come back.

SMOKE-EM

CANNED SMOKE

REG. U.S. PAT. OFF.

"SMOKE EM." THE GUARANTEED ROUP CURE

A discovery of the world's best known home of Registered Livestock and Trappeded Leborhns. The loss of thousands of dollars worth of our valuable fowls each year from your, colds, canker, diphtheria, and chicken-pox, either meant the discontinuation of our poultry department or to discover a genuine cure. Now our losses have absolutely discontinued. Over two hundred thousand States and Canada use and recommend "SMOKE EM," the most scientific DRUGLESS CURE that ever has been discovered. Inexpensive and easy to use. Eliminates the slow method of vaccination and injection of serums as preventives. Every cent of your money back if it fails. Used extensively in California, where every remedy is analyzed and closely scrutinized by the State Board of Health. Any remedy or preparation used in California must have genuine merits. Two hundred thousand testimonials on file at our office. Read what a National Breeder from the Noted Vineland Poultry Center, Mr. Robert Osborne, Vineland, N. J., writes: "My order for "SMOKE EM" reached me and I wish to say that after following the directions the results were almost magic. Nearly one thousand birds and some with their eyes swelled tight shut. It is now about one week since the last smoke and every bird looking fine. Before using "SMOKE EM" you could smell roup plainly throughout all the houses, but it is now gone entirely. It is sure one great cure for roup."

SAVE THE HEN

Mr. Chas. E. Schroeder, St. Peter, Illinois, writes us: "Last season my birds had a severe attack of chicken-pox and colds after returning from a show. After trying many remedies without success I decided to try 'SMOKE EM,' and must say it almost knocked it out over night. Have not had a cold in my flock since. Many have asked for 'SMOKE EM' after learning of wonderful results I have obtained."

Mr. David S. Schrock, Sterling, Ohio, writes us: "'SMOKE EM' is an absolute cure for roup. Last winter I had 350 hens and they began to get swelled eyes and cankers in the mouth. I killed about two dozen to doctor them, but I got too serious; then I used 'SMOKE EM' and it surely did wonders for them, and that was the turning point towards success, and then I also fed some DOUBLE HEALTH & EGG PRODUCER. It surely made their combs pretty and the eggs began to roll. 'SMOKE EM' took away my fear of roup this winter."

Mr. T. A. Hall, Milford, Delaware, writes: "I have been advised by a friend of mine, Mr. Edward Passwaters, Harley, Delaware, to try your roup remedy, 'SMOKE EM' canned smoke, as 'SMOKE EM' cured Mr. Passwater's fowls. The State furnished me with serum for vaccination and it is not checked yet, and as I have a very bad case of roup will appreciate your sending me 'SMOKE EM' at once, as I have faith in it."

You owe it to yourself and to your poultry to write for our large 32 page catalog and full information today. The Price is low. Dealers, we have a good proposition to offer you.

C. Sydney Cook, Jr., 71 Valentine St., West Newton, Mass.

scared, and soon become quite tame as a result of being gently taken out of the traps.

Said Mr. Smith: "When I come over to the contest and walk through the houses, I can tell pretty closely how the egg yield is running by the amount of water in the crocks. Or if I find hard droppings on the dropping boards, I know the egg yield is not up to what it should be. Hens in heavy lay drink a lot of water and produce a moist dropping."

A. D. Smith deserves much credit for the lay-out at Quincy. He started the contest with \$7,000 raised from Quincy business men. It was to be a demonstration plant for Adams county, of which Quincy, a town of 40,000, is the county seat. But, Smith couldn't hold his project down. People from all over the state besieged him for poultry information. So he and the Illinois breeders went to the Legislature and asked the state to make of the Quincy contest a state-wide project. An appropriation of \$16,000 a year for two years was granted, and the present Illinois State Egg Contests in Quincy and Murphysboro are the results.

Mr. Smith is optimistic of the future. An old fancier, secretary for years of not only the Quincy show, but also the Illinois State Show, Mr. Smith said: "The day is passed when the breeder can get any applause by saying, 'I don't care whether my hens will lay or not, just so they will produce winners.' The day is here when purebred chickens must combine the symmetry of the Standard and the practicability of the farm. Those who will profit by the lessons of the contest are going to be the leaders in the breeding business, provided they are Standard breeders. The die is set and the game is on. Illinois breeders have every assistance in helping them to attain leadership in the future as in the past. Our State Legislators have been liberal in their support of both the State Show and the State Contest. And the Governor as well as Secretary of Agriculture Davison, are regular 'chickenmen.'"

This article is based on the Quincy contest. The companion contest at Murphysboro, which ended Oct. 31st, had a Barred Rock that made 250 eggs in the year. She was entered by Jules Francais of Long Island, who won the Storrs Contest a year ago.

The high pen in the dual purpose class at Murphysboro produced 968 eggs in the year. It was composed of Rhode Island Whites. The five birds laid 201, 200, 208, 172, 142. Mr. Francais' Barred Rock pen individually produced 194, 250, 194, 140, 173, a total of 959. Where the five individual records, added together, do not produce the total given, the difference is in floor eggs credited to the pen.

A Winter Egg Record

My egg record from Nov. 1 to Mar. 1, 1922, from a flock of 72 pullets which I housed in a room at the east end of my barn, formerly used as a garage, 10 ft. wide, 16 ft. deep, 8 ft. high, shows an egg yield of 4,131 eggs on a feed cost of \$41.35. I used lights from 5 P. M. to 9 P. M. I fed 4 quarts of grain at night, 2 quarts in morning. Mash hoppers full all the time.

Wise.

C. J. BOLTE.

The Egg is $\frac{3}{4}$ Water

Heavy Drinkers are Heavy Layers

Each hen must drink one-fourth pint water every day to produce high priced winter eggs. *Water must be warm.* Hen's temperature is 110 degrees F. Don't let your hens drink ice cold water a single day this winter, for it will chill to the bone and may stop egg production a whole month. Why permit unnecessary loss when the

EUREKA Sanitary FOUNTAIN

KEEPS WATER WARM 24 HOURS

No lamp, no fire, no danger. No upkeep. No trouble. *Only up-to-date Sanitary Fountain.* Drinking cup does not project beyond outer can. No possible chance to catch litter or filth. No contamination to cause disease. *Water always warm, clean and pure.*

Made of heavy galvanized iron. Built like fireless cooker. Works like thermos bottle. Simply fill every evening with hot water—that's all. Hens will have plenty of pure, clean, warm water early in the morning just when they want it and need it most.

Water is a natural tonic just as important as feed. Get full value from high priced feeds. Increase egg production and profits by keeping warm water before your hens all the time.

The heavy drinkers are heavy layers. 100 layers will drink 12 to 15 quarts of water a day. Just think of it! The egg is three-fourths water! Every hen you have must drink one-fourth pint water every day or she cannot produce. Only warm water can be consumed in this quantity, in cold weather. *The water must be as nearly*

clean, pure and fresh at all times as the water you drink yourself. This cannot be done with open containers. The *Eureka Sanitary Fountain* is not a luxury. It is a necessity—a year round fountain. It keeps warm water warm 'n winter and cold water cool in summer.

Winter Eggs Bring Big Profits—Get ready now to make these profits. Eggs are now rapidly going up in price. Winter eggs are more than double the summer price. If you get three-fourths as many eggs in winter as you do in early summer you can make four times as much money, for the profit will be infinitely greater. Anyone can make a hen lay in springtime. Only proper care will make them lay when eggs are high.

Money Back Trial Offer

You can't afford to be without the "Eureka." It pays for itself in 30 days. Last years. Thousands of satisfied users. Order today for you take no risk—no chance whatever. If you are not absolutely satisfied that it's the best fountain you ever saw or used, or if you are not entirely satisfied in every way, you get your money back. *Order direct from this ad today. Don't put it off. It means greater profit to you, more eggs than ever before, a healthy, happy, money-making flock. Order at once—NOW!*

White Leghorns

—WIN—

My pen wins the silver cup and blue ribbon for highest production at the Southern California Egg Laying Contest, year ending Sept. 30th, with a total of 2260 eggs, an average of 226 eggs per bird.

WITHOUT THE USE OF ELECTRIC LIGHTS OR FORCED FEEDING DURING THE ENTIRE YEAR.

Seventy-seven eggs more than their nearest competitor. Forty-eight pens competing.

At the Western Washington contest ending Oct. 31st, my pen layed 1175 eggs (one bird died in June). Two of the remaining four layed 301 and 305 eggs respectively.

Remember These Are Official Records

I have for sale 400 of the finest cockerels I ever raised, positively every one from hens with actual trap nest records from 200 to 296 eggs and sired by males from 250 (or better) egg dams. And the prices are reasonable.

Write me just what you want and I will do my best to please you.

HILLPOT

QUALITY CHICKS

White Leghorns

for poultrymen who want real EGG PROFITS;
any quantity you want, when you want them.

Sturdy, vigorous chicks, full of vitality, well-hatched from Hillpot Selected Leghorn Strains—the superior egg-production of which is proved, not by a few high records, but by the profit-experiences of our thousands of satisfied customers. The quality that brought about more than a hundred-fold increase in our business in the past nine years is further improved for 1923 by intensive selection of highest egg producers.

Of Mating A, and of B matings—highest values per dollar invested you can find anywhere—the quantity is limited. Early orders are suggested.

Feed cost \$37.56
—Eggs laid 3052

between November 29th and July 31st, 1922, is record reported on 21 pullets raised from Hillpot B Mating Chicks by C. K. Holbrook, L. I.

UNIQUE PERFORMANCE OF BARRED ROCK PULLET

Down in Prince Edward Island, Canada, there is a Barred Rock pullet that is surely worthy of a place in the Hall of Fame, and indeed there is a flock of them out to establish records.

Consider this ambition of Youth: The Rev. A. McAuley, of St. Peters, in that small Canadian province, purchased last Spring a setting of Barred Rock eggs, which hatched out May 1st and 2nd. The chickens were strong and healthy and were on free range and were carefully and liberally fed, with lots of sour milk included in the diet. They wandered at will in the thick bush or wood near the house, and under these conditions, with plenty of food and shade, they developed rapidly throughout the Summer. Nevertheless it was with some surprise that on the tenth of September some nests were found in the woods, each containing from one to several eggs laid by these four-months-old pullets. Starting to lay so early, they took up more attention and were carefully watched, and some time afterwards it was noticed that one of the number was missing. It was thought that this pullet had died or was lost, and nothing more was thought of it until October 22nd, when the pullet was found presiding calmly over a nest in the bush, in which there were eight newly hatched chickens, as well as eight eggs unhatched.

These eight chickens are all strong and well—and with every prospect of remaining so. It would seem to be rather ambitious work on the part of this youngster.—W. D. MacNeill, Canada.

Correction

Editor, American Poultry Journal,

You favored me by publishing in October A. P. J., an account of my experience feeding Epsom Salts as a substitute for green feed during fall and winter months.

I stated that I gave my birds one ounce of salts in moist mash to every six birds.

This was an error, as I give them one level tablespoon for every fifteen hens; this is about one half ounce.

One ounce to six hens would be a physic to be used seldom.

Am unable to account for this grave mistake that I made in giving the estimated amount per bird for I intended the report to be a help as it has been to me through the winter months. Will you please mention this terrible blunder in the A. P. J. columns and pardon me.

Ky.

E. B. MCQUOWN.

Hen (run over by owner's car): "And to think it was my eggs that helped pay for the darn thing!"

Miller's Ideal Mammoth Incubators

48-Hour Service on All Mammoth Orders

That's a mighty strong statement but Miller Service is just about as well-known to our customers as Miller quality.

Here in our big modern factory, equipped with the most improved machinery, we can turn out an unlimited quantity of Mammoth Incubators within 48 hours after receipt of orders. This kind of service means much to prospective buyers. Delays in the poultry business are troublesome and costly. When you send an order to us you have the satisfaction of knowing that it will be handled with utmost speed by an organization of Incubator Specialists.

Mammoth Triple-Deck Incubators

The illustration shows the Ideal Mammoth Triple-Deck Incubator—the only three-deck machine that maintains a uniform temperature in all three decks. This is accomplished by a specially designed heating system. Operating costs are reduced to a minimum because of the compactness of this machine. It allows the installation of greater egg capacity with a minimum requirement of additional floor space.

The unit form of construction allows you to start hatches on any scale desired—then to add more units as your business grows.

Write today for my new catalog. It tells the whole story about the most efficient hatching equipment on the market. Special offer to those who order early.

J. W. MILLER CO.

Box 2

ROCKFORD, ILL.

Prairie Depot, Ohio
May 19, 1922.

J. W. Miller Co.,
Rockford, Illinois.

Gentlemen:

Owing to the fine results we have had with our Ideal Mammoth Triple Deck machine purchased from you last season, we feel that we would be doing you an injustice if we did not tell you of the splendid hatches we have had.

I have operated a good many different makes of incubators, and your Ideal Mammoth has one of the finest heating systems I have ever seen. The Ideal Triple Deck is a wonderful space saver, and we find the top deck hatches equally as well as the lower and middle deck.

Recently we pulled off a wonderful hatch, running 83% of all eggs set, and our help told me they took as high as 159 good, strong chicks off of the trays that had only 168 eggs to start with.

Thanking you for your fine treatment.

Yours very truly,

PIERCE SUPERIOR CHICK HATCHERY

E. M. Pierce, Manager.

HATCH EVERY GOOD EGG *with* SOFT HEAT

Stronger Chicks
Less Expense
Less Trouble
More Money

MR. J. R. SINGLETON, Alba, Texas, writes that he made \$404.11 profit with one medium size Porter SOFT-HEAT Incubator in about 4 months. Sold 250 baby chicks and 200 broilers, and had 250 pullets and 120 cockerels left for himself. He further writes that the Porter SOFT-HEAT is so much better than a hen to hatch with that he will never set hens any more. Wm. Richardson, 31 Ann St., Pittson, Pa., writes that his first hatch paid for the machine and that he got 100% perfect hatches with an average of 98%. Over 20,000 successful poultry raisers wrote us last year. The results of the SOFT-HEAT prove that it is more than an incubator. In fact it is an automatic, hatching marvel that beats the hen.

Moist Warmth—A Life Saver. Moisture is necessary to life. Both eggs and chicks need it. The Porter supplies it automatically. Simple and certain. You can get big hatches and make easy money with

The Porter SOFT-HEAT Incubator

Duplicates Nature's process exactly. Turns every good egg into a strong, perfect chick. Principle endorsed by U. S. Government. Pronounced the greatest of incubator improvements.

No Suffocation—No Cripples. Eggs don't dry out in Soft-Heat. Moist warmth keeps shells brittle and membranes tender. Chicks break through easily and breathe pure, fresh air instead of poison-laden gases, from the very first. *The Porter hatches no cripples.*

Soft Heat Saves 300% in money, time and labor. 3 to 4 quarts of oil—one filling of tank—completes a hatch. Others burn 4 to 5 gallons and require daily filling of lamp.

Only 2 Minutes' Care Daily. Eggs are turned semi-automatically without removing or lifting tray, reducing necessary care to 2 or 3 minutes a day. A child can operate the Porter.

Make More Money This Year! Take your hatching away from unreliable hens and dead air incubators. Get MORE and BETTER chicks, decrease your losses and increase your profits with the improved Soft-Heat. Use the most scientific incubator ever made. **SHIPPED PREPAID.**

Book Free! Fully illustrated. Explains Soft-Heat in detail. Gives interesting stories of success from many states. Tells how you can succeed and make money from the start with this BETTER hatcher. Send name today—a card will do—for your free copy.

Porter Incubator Co. 306 Porter Bldg., Blair, Nebr.

Thermometer,
Eggs and Chicks
in Plain View
Under Glass.

100 to 1100 Egg Sizes.

Tubeless. Full radiator plate does away with cumbersome, unsatisfactory tubes and pipes.

Smokeless, gasless, odorless, less. Nothing but pure moist air reaches egg chamber.

Center Heat. No side lamp. Saves space and weight. Insures equal heating. Radiation from above, as hen supplies it.

Round Egg Chamber—Just like hen's nest. Makes turning of eggs quick and easy.

Automatic Control of moisture, heat and ventilation. Requires no attention. Steady, even supply assured, regardless of altitude or weather.

Electric Models, Too

In addition to the standard Porter Soft-Heat which burns coal oil, we have automatic electric machines and combination electric and coal oil, so that either source of heat may be used. The electrical equipment costs only a nominal amount.

COSCO FARM

S. C. WHITE LEGHORNS

First prize old pen
Cock, Madison Square
Garden, 1922.

For the past five years we have bred and exhibited our Single Comb White Leghorns in the foremost shows of America and Canada, and at no time have we offered any of our products for sale, not wanting to do so until such times as we were satisfied that we had the quality

Second prize pullet,
Madison Square
Garden, 1920.

that the most exacting buyer would be perfectly satisfied with.

During this time we have purchased the entire flock of one thousand birds from Sunny-Brae Farms, Port Dover, Ont., the entire flock of Frank H. Davey, Yonkers, N. Y., besides having the privilege of selecting all the exhibition birds from the entire breeding pens of Wilburtha Farms, Trenton Junction, N. J.

With this combination of breeding and exhibition blood we feel that the time has now arrived to announce that we now have for sale

1000 MALES AND FEMALES

of the pure D. W. Young strain; that we are also booking orders for *Eggs* and *Baby Chicks* for future delivery.

We also wish to announce that our birds will be exhibited at the foremost shows of America this season.

Cosco White Leghorns are now making records in some of the leading egg-laying contests in the country.

Send for Our Mating List and Catalog.

COSCO FARM, R. F. D 3, KNOX, IND.

World's Headquarters For Buff Orpingtons

Owen Farms were founded in 1904. The finest Buff Orpingtons in England were imported in 1904 and the two ensuing years. Again in 1910 the winners at the Dairy and Crystal Palace show were bought and imported. On this magnificent base was built the Owen Farms Strain. Nearly every good flock in America is wholly or partly Owen Farms blood lines. Each year splendid specimens are exported and are preferred wherever they have gone to birds purchased in England. Crashing victories year after year at Madison Square Garden, Boston, Chicago, and other leading shows established the absolute supremacy of Owen Farms Buff Orpingtons. The past few years very little showing has been done. Have been content to let customers do the winning.

1922 Youngsters

are simply magnificent. Large, massive birds with great purity, soundness and evenness of color. You will find here grand exhibition cocks and cockerels at \$25.00, \$35.00 and \$50.00 each and hens and pullets at \$15.00 and \$25.00 each. A few stars for the hot-test shows a matter for correspondence. Fine big husky utility and good breeding cockerels at \$7.50, \$10.00 and \$15.00 each. Hens and pullets \$5.00, \$7.50 and \$10.00 each.

Write me your full requirements, receive my 84 page booklet and will gladly give you the benefit of my 24 years experience in breeding Buff birds to the highest perfection of form, color and egg production.

The two great general purpose breeds. Winners at America's leading shows. A choice lot of stock for sale, both old and young. All stock guaranteed to give satisfaction. We expect to be ready to furnish eggs for hatching by Jan. 1st. Send for Catalog. A. & E. Tarbox, Box 4, Yorkville, Ill.

STRINGMEN AT FALL SHOW

Editor, A. P. J.:

"Referring to page 1024 Nov. issue A. P. J. letter from Mr. W. N. Watson,—Penn. Buff Cochins breeder.

"As far as the 'disease spreading stringman' is concerned, my experience has been, every time my birds came home with disease they caught it from some slack local exhibitor.

"The writer showed against one of the stringmen, that was at York, Pa. Fair, the week previous to York and did not see any sick or diseased birds, and we showed under a tent the worst place to show poultry.

"Railroading birds from fair to fair is the most unnatural thing in the world for fowl, and of course some get out of condition, but how can a poor man get his winter grain bill for these rare varieties and incidentally raise a family, without collecting some of the prize money offered. The poor caretaker is fast dropping from the ranks.

"Most fall fairs, and some that receive State money look upon the poultry exhibit as an attraction, the same as any free attraction, and charge the Poultry Exhibit expenses—in the 'Attraction Column' on the books of the association—They really want a big well filled exhibit.

Please do not misunderstand me, I am not running down the specialty breeder and I do not favor showing out of conditioned birds. It is true I don't show the numbers I have in years past—as other business takes most of my time—so I only show what I can carry on my car. I am glad to be known as a showman, and I enjoy camping with the so-called "hucksters," and practically all the conversation is on breeding, raising and showing chickens, morning, noon and night, frequently into the following morning—for the best informed, all round judges of today made the fall fairs in a freight car a few years back.

Mass.

HOWARD S. RICH.

J. H. Drevendstedt, editor of American Poultry fancier, under the head: "Professional Showmen at Early 'ows," says:

"The question whether stringmen are an asset or a liability to a fall fair chicken show is again on the carpet, open for free discussion by the pros and cons. This time Frank L. Platt starts that perennial blooming question by his remarks in October American Poultry Journal once more around the circuit.

"Thinking over and agreeing on this stringmen proposition is a very ripe subject for discussion, one which should be approached with cool judgment and an open mind. We must bear in mind the fact of there being stringmen today and of there having been stringmen yesterday—two very different propositions. The evolution of the old "punkin show" county fair into a modern institution where Standard classification and Standard Judging is the rule, has worked great changes in stringmen's exhibits. The stringmen of today must have pretty fair stock if he expects to win at county and state fairs. His bread and butter depends upon that.

Fall fairs can hardly afford to make hard and fast rules to govern their poultry exhibits, if they hope to stage a fairly well-balanced show.

Competition invites quality of entries, and as competition grows stronger, quality usually also becomes stronger. This means that better birds must be produced and conditioned for our shows if exhibitors expect to win the coveted cash prizes at our summer and fall fair shows. There is none who realizes this more than the experienced stringman. He keeps quite abreast of the times, and if he may fail to exhibit his birds in the pink of condition always, he usually does not fail in having breeds and varieties that come up to a reasonably high standard. What is more he knows what a good bird really is like, in fact, we have found some of the keenest Judges of Standard poultry among the stringmen making the circuit of American fall fair poultry shows."

Mr. Drevendstedt then concludes his remarks by saying that the stringman should not be banished but judges should penalize birds that are out of condition as a result of over showing and over cooping.

Let Water Double Winter Egg Production

It Will Do This—We Guarantee It, Thus—

If you are following the too-common plan of watering your flock but once a day and will order and use enough **NORWICH AUTOMATIC AIR-LOCK FOUNTAINS** to properly water your birds, we guarantee that the daily egg-production will be doubled. If it is not, if you are not 100% satisfied, we will refund your money without argument.

Thus do we manifest our faith in what is unquestionably the most efficient device for speeding up laying hens. Under this money-back guarantee you simply can't lose, but you will win. A few dozen eggs at winter prices will pay for this durable equipment and the many other extra dozens—this season and many more—will be clean profit. Hurry your order in today and put your flock in the big-profit class at once.

Here is another sure-thing proposition. If you are in the poultry business on a commercial scale, keep several hundred layers, we will equip your plant with **NORWICH AUTOMATIC AIR-LOCK FOUNTAINS** and let the extra eggs they produce pay for them. Write for details of this unusual offer, stating number and breed of fowls you own. Our prompt reply will astonish and delight you.

You want winter eggs! You can produce them in large quantities—if you will. Will you? These offers are a "show down." If you are in earnest, if you deserve success, you will stop wishing and act at once.

Read this:—"Water costs nothing, yet it is as essential to growth and egg-production as is the feed. Hens can't make eggs unless they have this fluid in abundance." (Prof. Stoneburn, New York WORLD.) "From the hen's viewpoint, water is worth just as much as feed. Therefore the man who furnishes high priced feed but neglects the water supply, is making a great mistake and will have to be content with a limited egg yield." (Missouri State Board of Poultry Culture.) "Your Fountain was used all winter with perfect success, and this in temperature as cold as sixty degrees below zero." (T. A. Firth, Dawson, Yukon Territory, Canada.)

5 Gallons Capacity
Price \$6.00 f. o. b. New London, Conn., St. Louis, Mo., or Wichita, Kan.

Hens can't lay without plenty of water—the Norwich Automatic Air-Lock Fountain supplies clean water at the proper temperature regardless of the weather—this Fountain is guaranteed to operate satisfactorily and increase the egg yield—a test will cost nothing if you are not entirely satisfied.

What more can we do to help you make your flock pay bigger profits? If you can think of anything more, write us. If our reasoning is logical and our offer entirely fair, if you really want to give your birds a square deal, send your order for the fountains you need—and do it now. The longer you delay the more you lose!

Poultry Books at a Cut Price

A complete poultry library that covers every phase of the industry. \$5.00 complete poultry library for only \$5.00. A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and by taking them all at a cut price, you will be well equipped to make a success of this business.

Save One-third by Ordering Six or More of these Books Now

How to Raise Chicks, by Dr. Prince T. Wood. A down-to-date manual on breeding poultry, getting hatchable eggs, incubation and brooding, both natural and artificial, preparing chick foods, feeding chicks, how to raise chicks and how to avoid and prevent diseases and losses. Tells how to make your own brooders and chick foods. 128 pages, 35 illustrations. Price 75c postpaid.

999 Questions and Answers, by Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information and right to the point. 124 pages. 75c postpaid.

Poultry Account Book. This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. A guide to making your business more profitable. Printed on paper suitable for ink. Price 25c.

Open Air Poultry Houses for All Climates, by Dr. Prince T. Wood. Tells plainly just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by successful breeders. 75c postpaid.

Origin and History of All Breeds of Poultry. Tells you where the breeds originated, what varieties were crossed to produce certain qualifications in a new breed; how they were recrossed until perfect. Postpaid, per copy, \$1.00.

A Revolution in Egg Production, by George C. Newell. Read this book and learn how you can lengthen the hen's working day in winter by the use of lights in the hen house when egg yield is lowest. It shows how you can increase the Winter egg yield 100 per cent. Cloth bound, \$1.00 postpaid.

\$4223.00 in One Year on a Town Lot, by H. Cecil Sheppard. Shows how with a very limited knowledge of the poultry business and small capital, he built up a profitable business. Cloth bound, price, \$1.00 postpaid.

How to Build Poultry Houses. Why Poultry Pays and How to Make It Pay.

AMERICAN POULTRY JOURNAL, 523 Plymouth Ct., Chicago, Ill.

Palmer's Barred Rocks

again demonstrated their superiority at one of America's best fall Fairs—Central States Exp., Aurora. They won on five entries in the five exhibition classes, 1st cock, hen, cockerel, pullet and pen. What our Barred Rocks have done for us this fall in winning five firsts out of a possible five, they can do for you. Please remember our unapproachable records made at the Chicago Coliseum for the past 25 years, where we have won more displays and ribbons than any three competitors combined. If you wish winning show birds that will make strong breeders as well as winners, we have them. Write at once for prices and descriptive literature.

D. F. PALMER & SON,
Box 35 Yorkville, Ill.

SHIP Your Eggs in "Surety Cushion" Returnable Wooden Egg-Cases.

Not an experiment. In use by poultrymen for several years. State Colleges recommend them. Send for price list circular. Also manufacturers of "Surety Cushion" corrugated Parcel Post Egg Boxes.

SURETY EGG BOX CO., Dept. 6, Hohokus, N.J.

"INCREASED EGG PRODUCTION"

"Any one can well afford to purchase one or more of your Stoves and rest assured that the increased egg production, not to mention the fact of the greater ease in which the water supply is furnished to the birds, will more than pay for his expense."

This is the statement of Mr. N. L. Harris, Extension Poultryman of the Kansas State Agricultural College, after trying out a Little Putnam Stove under most adverse conditions.

You cannot afford to be without one. Burns one month without attention. Ask your dealer for a Little Putnam Stove. If he does not carry it, send \$2.00 to I. Putnam, Route 1205-R, Elmira, N. Y., and one will be promptly mailed fully prepaid. Read advertisement on page 1116.—Adv.

13 Eggs a Day Instead of ONE

Mrs. Wm. Bradshaw of Crooksville, Ohio, writes:

"I have used your More Eggs Tonic one month and it has increased the egg production from 1 and 3 eggs a day to 12 and 13 eggs a day. I believe it is a fine tonic as my hens were moulting when I began to use it. I got 147 eggs in November."

More Eggs Tonic keeps hens in the best possible laying condition. It is a concentrated tonic, not a food. It contains every element that helps make eggs.

Start using More Eggs Tonic right now. Keep your hens laying right through the coldest weather when eggs are highest. You can get big profits from your hens this winter, just as hundreds of other More Eggs users are doing.

Hens Lay All Winter

Results tell the story. Here are just a few letters from poultry raisers who are getting more eggs and more profits through the use of Reefer's MORE EGGS Tonic.

1500 Eggs in 21 Days.

"Dear Mr. Reefer: I have fed two boxes of More-Eggs to my hens and I think they have broken the egg record. I have 160 white Leghorn hens and in exactly 21 days I got 125 dozen eggs."—H. M. PATTON.

Gets 132 Eggs on December 1

"Dear Mr. Reefer: Sometime ago I got some of your More-Eggs and it meant MORE EGGS. I am now fully convinced of its utility. I have 14 pullets and 14 hens one year old and the first 10 days in December they laid 11 dozen eggs."—H. F. POHLAND, President Citizens' Bank, Ashland, Oregon.

Free \$1 Pkg.

Send no money just the coupon. In a few days the postman will bring you TWO \$1 packages of MORE EGGS Tonic. You pay for one package only. The other package is free. If you are not fully satisfied with MORE EGGS Tonic at the end of 30 days, your money will be refunded instantly. You take no risk. Don't delay. Send for this guaranteed egg producer and profit maker at once. Mail the coupon.

The Complete Dormant Spray

Let SCALECIDE be your dormant spray. Then you will know that you have done all that can be done at that particular time by any dormant spray or combination of sprays. Fall spraying with SCALECIDE controls pear psylla and peach leaf curl. Spring application controls aphids, pear thrips, leaf minor, case bearer and leaf roller. Either fall or spring spraying with SCALECIDE controls scale, bud moth, European red mite, fungus or blight cankers from which are spread fire blight, collar rot and root rot. And in addition to controlling these insects and diseases, year after year use of SCALECIDE invigorates the trees.

Write today for copy of our guarantee. Ask for booklet, "Spraying the Home Garden." Address Dept. 21.

It seems but a day since sitting at my desk I expressed the sincere hope that every reader of the American Poultry Journal and those engaged in the making of this magazine would have a Merry Christmas day and many of them. Christmas is the great heart of all the year when the warm glow of the cheery Yule-log lights up the chimney corners of our memory, and we exchange greetings and good wishes for a season of peace and a year bright with hope and joy.

"Little House of Christmas, in your white lane set,

Half-way 'twixt the highways of Remember and Forget.

Once a year your windows wake with welcome taper glow,

Once a year your gate swings wide to feet of long ago.

"Little House of Christmas, at your fragrant feast,

All are bidden to the board, the greatest and the least;

Silk and velvet-mantled Hopes rub elbows side by side

With little, tattered, beggared Dreams that crept in wistful-eyed."

"Little House of Christmas, all drifted deep with snow,

Holy-decked, and sweet with fir, and hung with mistletoe,

All the roads of all the world, cheerless were, and drear,

Were your blazing Yule-logs quenched that beckon once a year."

"Hands stretch welcome at your sill the years have thrust apart,

Memories clasp tender arms about each lonely heart,

Long-lost faces gather close, voices loved of old

Ring across the holly boughs beneath the taper gold."

"Little House of Christmas, in your white lane set,

Half-way 'twixt the highways of Remember and Forget;

May each storm-blown wanderer, weary and alone,

Hear some voice call cheer to him across your lintel stone."

My prayer is that for each and every one of you the year may leisurely linger, bringing to you all you deem necessary to your happiness and welfare.

* * *

For the horticulturalist and all those who love and care for fruit trees, vines and shrubs, and for the lovers of flowers this is, indeed, a wonderful time of year. Many of the trees and shrubs and plants are now asleep, awaiting the resurrection day which will come with the warmth of spring. We gathered a bountiful harvest of fruit and flowers, and in the fall days we tenderly cared for trees and vines, tucking them in their winter bed as tenderly as a mother puts her child to bed at night. We sang as we worked and our hearts were free of thanksgiving, and of life for another full crop of fruit and bloom next season. And because our hearts are in all this we will surely be given our desire and our wishes will be fulfilled in overflowing measure.

I have been a reader of the Journal for quite a few years. I bought a 180x195 foot place on the northwest end of Chicago city limits. I want to plant a few fruit trees such as apple, pear, peach, cherries, and plum. Also grapes and strawberries and a few bushes of fruit. My land was sub-divided from a farm. It is a black soil.

Illinois.

PAUL BOLDT.

For a family orchard plant Duchess, Wealthy, Senator, King David and Delicious apple trees. Keiffer, Lincoln and Sickle pears will be best for you to plant. Would not plant peach trees. The climate is too severely cold. Early Richmond and Montmorency are the most desirable cherries. Omaha, Terry and Surprise will give you an abundance of plums. If you plant Moore's Early, Diamond, Delaware, Niagara, Worden and Concord grapes you will have a good crop each year. For your

The sisters of above male bird, owned by the Northland Farms of Grand Rapids, Mich., won 26 Certificates of Award in the 1921-1922 Illinois Egg Laying Contest.

location Senator, Haviland, Sample and Brandywine are the best strawberries. Advise you to plant Oregon Champion gooseberry and Red Cross and Fay currants.

* * *

I have an idea of taking up a homestead in one of the plains states, with the object of growing apples under irrigation in addition to stock raising. Would not have any money of any account to put into it, but enough to keep me going with what work I could reasonably expect to get.

What do you think of the Powder River country in Wyoming? I know it is not really an apple section, but would it do, considering the local demand for apples? Do you think an apple orchard could be made a success there (of course under irrigation)? Would you advise going farther south? I want to work into beef cattle also. What would be your choice of a location with these purposes in view?

New York.

J. C. PHILLIPS.

I advise you not to attempt to establish a commercial apple orchard in the section of Wyoming to which you refer. Anyone wishing to engage in apple growing can not find a better location than New York. For a combination of commercial apple raising and stock raising I think the Valley of Virginia or the Piedmont section of Virginia offer the best inducements.

In fact, for such a combination conditions in either of these sections are ideal—soil, climate, water, short winters and nearness to market.

I see what you say to enquirers about North Carolina and Virginia being an ideal location for fruit and poultry, also that parts of Virginia are rich in all that makes life worth living, that there is no better place in the world to live, etc.

After hearing such splendid reports, it looks like folly to ask more, but I wish your advice as to a location of these places over the Ozark section of N. W. Arkansas and S. W. Missouri. I live in the Black-land section of North Central Texas which is not ideal for either fruit or poultry, being very subject to droughts. We have just had an extremely long hot summer that nearly got my goat.

I am about 400 miles from the fruit center of N. W. Arkansas and about 1500 from Virginia. I think of making a trip in my car to Arkansas in the near future. Would you advise that I extend this trip to take in Roanoke, Staunton and Charlottesville, Va., and Ashville and Waynesville, N. C. and investigate each of these sections before selecting a location; and do you think that North Carolina or Virginia is enough nearer the Eastern markets to justify the longer move?

I want an ideal place to live where I can engage in fruit and poultry raising, with nothing in the way except to find the right place. Arkansas. DR. G. W. COLLINS.

I greatly favor the fruit districts of Virginia and North Carolina over those of Arkansas for the reason that they (the former) are nearer the best markets. The climate conditions, too, are better.

If you will go to the places in Virginia that you name you will see for yourself the most wonderful and profitable apple orchards in the U. S. I strongly advise you to do this.

I want to cover the top and sides of my poultry yard with a vine but do not know just what one is best.

I want a vine that will give plenty of shade and still does not cut off the air too much.

Please advise what kind of a vine is best. Wisconsin. MAX R. MAROON.

The run ivy introduced by the Elliott Nursery Co., Pittsburgh, Pa., is ideal for your use.

The grape vine is very good for this purpose.

Kindly advise me whether a fruit and poultry farm located about 100 miles from Charlotte, N. C. and Winston-Salem, N. C., would be too far from market. These two cities are the largest in the state.

I have a chance to buy 23½ acres near Lenoir, N. C. The land is rolling and it is in the foot hills of the mountains.

Could I grow good apples there? What kind of soil would you advise me to set? I would prefer some good winter eating apple. I would like to set out about two acres in fruit and about 1½ or 2 acres in strawberries. What kind of strawberries would be best?

About half of the 23½ acres are cleared and have a southern exposure. There is no running water on the place and it lies high and is nearly level.

North Carolina. W. J. KEEVER.

A combination poultry and fruit farm location as you state, should be very profitable if properly managed. You would not be too far from a very good market. Plant Delicious, Stayman, Black Ben and Golden Delicious Apples. These are all winter varieties of high order and command top prices in the market.

Senator, Haveland, Sample and Farrell strawberries are suited to your needs and soil and climatic conditions.

I have a beautiful catwaba tree in my back yard. How can I start some little ones from it?

Have a young Rose of Sharon bush just

Smith's New Agi-Feeder

Patent Applied For

The feeder with an agitator on the inside operated by the Poultry. The Fowl operates the agitator as easily as you would operate the spacer on a typewriter, every time the hen steps on the platform she spells FEED, FEED, FEED. Guaranteed not to clog, because it can't. Eliminates waste, sanitary, in fact it possesses all the good points a feeder should have, besides having an agitator that assures your fowls all the dry mash they want at all times and dry mash means eggs. Made in three sizes—30x24—24x24—18x24. Price \$7.50, \$6.50 and \$5.50.

Special Offers—for December

Cockerel Bargains

WHAT YOU WILL RECEIVE FOR—

For \$5⁰⁰

—a June hatched cockerel bred from Hoganized high-egg-producing hens. Worth 100 cents on the dollar just

as he stands. Grow him out with 50c worth of feed and he will double in value. His daughters will average high as layers, and his careful breeding will add refinement, quality, stamina to your flock.

\$7⁵⁰

—a May or early June hatched cockerel bred from a classy pen of Standard type, Hoganized, high-egg-producing females. When fully mature ought to be worth twice the price. Quality enough to win top place in many medium-sized shows little later on. Bargains every one. Ten years ago such a cockerel would sell for from \$25 to \$35.

\$10⁰⁰

—a beautiful, big, carefully-grown, fully-furnished cockerel that will attract a lot of attention. Real Leghorn type, good in every section, attractive concave turn of body. Plumage naturally snow-white, and a head, comb, breast, back, saddle, tail and thigh that will stand closest inspection by any keen Leghorn judge. Quality talks. Every one "a living advertisement" of Oak Dale's square-deal policy.

Pullet Bargains

WHAT YOU WILL RECEIVE FOR—

For \$3⁰⁰

—a real Standard-type, high-egg-bred, well-matured pullet, sired by a strong sire and bred from a pen of

heavy-laying Hoganized females. \$3.00 per bird is a rock-bottom price for pullets of this type.

\$5⁰⁰

—a typey, white-quill pullet that is rounding out into beautiful pullet form. Combines eggs and beauty.

Bred from proven producers, these pullets are sure to pay dividends. Try a small pen of these pullets as a means of introducing new blood into your flock.

\$7⁵⁰

—a clean-cut, attractive pullet with size and show-room merit, quality of feather and egg capacity. Nice, strong

rangy big pullets with good head-points, clean-cut outlines, length, medium or low tail carriage (state preference) and pure white plumage. Many will develop into exhibition hens worth \$15 to \$30.

Read This Carefully!

¶ These birds were not developed enough for the October Sale. They are now grown-out, developed. Because it is an Oak Dale policy to offer only stock that is absolutely right these 1922-hatch birds were held out for this month's offering. ¶ Save time and correspondence. Order direct from this advertisement. Write fully, describe your needs. Please let Mr. Lamon know what sections of the birds you prefer strongest so that he can select individuals that will improve your flock. This is important! ¶ Order early. They will not last long.

SHOW CKLS.

—magnificent, big, racy youngsters. Outstanding "stars." Wonderful breed character, masculinity quality and type. Blue-bloods with 20 generations of masterful line-breeding in their pedigrees. Close blood-relations of the greatest show winners in U. S. and Canada. Every one 100% absolutely pure D. W. Young blood. Washed, groomed, trained—ready to win, regardless of competition. Describe your needs.

SHOW PLTS.

—full sisters to matchless exhibition cockerels. Winners without question this winter. Bred from pens of absolutely pure D. W. Young blood—pens that expert breeders said contained more sensational show hens than any pens ever mated. Delivered in beautiful "bloom" of plumage. Sterling values. Beauties every one. Champions among them. Describe needs in detail.

BIRDS WORTH THE MONEY

Stockton, Cal., Oct. 26, 1922.

Dear Mr. Lamon: I received the cockerel and ten pullets, and for type and good points I am perfectly satisfied. They are well worth the money and I certainly got a square deal.

JACK LEE, 1215 S. Centre.

WON 1st AND BEST DISPLAY

Newport News, Va., Oct. 20, 1922.

Dear Mr. Lamon: I showed the wonderful pen of birds you sent me at the Williamsburg Fair. Won first, and also best display.

E. P. HORNLEIN, Box 47.

AVERAGED \$4.00 EACH

Schenevus, N. Y., Oct. 6, 1922.

Dear Sir: My flock of 275 pullets (D. W. Young strain) averaged four dollars profit each above feed cost for 1921.

H. C. DENNY.

If there is, anywhere in America, a single dissatisfied customer of Oak Dale Farm, let him state his case, set his own adjustment, and address his letter to Mr. Lamon personally.

There is only one policy at Oak Dale—a square deal, regardless!

For evidence, the owners of Oak Dale submit this page of letters.

LAMON—"The Master Breeder"

Your order filled to your entire satisfaction is my personal guarantee.

Harry M. Lamon

WON SPECIAL PEN

North Fork, Va., Sept. 16, 1922.

Dear Mr. Lamon: The cockerel arrived in time for the Fair. I did not enter him in the single class, but headed a young pen with him and won first prize, also won best pen of all varieties in show. Thanking you for your prompt shipment.

JOHN COCKERILL.

SPECIAL PULLET FOR ENTIRE SHOW

Fort Benning, Ga., Oct. 15, 1922.

Dear Mr. Lamon: At the Chattahoochee Valley Fair this past week, with about a thousand birds shown, one of the pullets purchased from you won first and special pullet in the entire show.

FRANK D. SMITH.

APPRECIATES FINE SERVICE

Cambridge, Ia., June 27, 1922.

Dear Sirs: Please accept my hearty thanks for the replacement setting of eggs sent me by you. It again shows the wonderful service and satisfaction given a customer by Oak Dale Farms that I have so often read about in the poultry magazines.

LLOYD RITLAND.

WON FIRST ON PEN

Lakeville, Minn., Oct. 20, 1922.

Dear Mr. Lamon: I sent eight birds to the Scott County Fair in the month of September. There were five pullets and three cockerels; four pullets and one cockerel won the first prize. Another cockerel won 3d prize. Six birds out of the eight were prize winners. I must say there were several hundred on exhibition. A representative of the Government Poultry Department looked over my flock of one thousand birds last week and expressed himself thus: "Finest flock of S. C. White Leghorns I have seen for some time."

BAREV A. KELJIK.

WON NEARLY EVERY-THING

Asotin, Wash., Sept. 20, 1922.

Gentlemen: At the Lewiston-Clarkston Tri-State Fair, I entered fifteen birds, all Oak Dale stock, and received the following premiums: first on cock, and first and second and third on hens; 1-2-3-4-5 on cockerels; special prize on the best ten birds; five best cockerels, and the first on the five best pullets.

G. A. FRASER.

BIRDS ARE MIGHTY FINE

Nevada, Iowa, Aug. 31, 1922.

Dear Sir: I received the pen of birds some time ago and am very well pleased with them. I certainly appreciate your interest in the matter and think that I have some mighty fine birds.

H. M. VINSEL.

LAID THE NEXT DAY

Millersburg, Pa., Oct. 27, 1922.

Gentlemen: Received my four hens and cockerels O. K. on the 26th and received the first egg on Oct. 27th. I am very much pleased with the birds.

J. HENRY CABLE, 336 Center St.

Bates bred practically perfect cattle by line-breeding. D. W. Young nearly attained Perfection in Leghorns by line-breeding. Harry M. Lamon is "carrying on" from the place where D. W. Young "left off" by line-breeding Oak Dale's 100% pure D. W. Young Leghorns.

SPECIAL FOR BEST EGG TYPE

Bemidji, Minn., Oct. 12, 1922.

Gentlemen: I took a pen of youngsters sired by the male that I got from you last spring to the Northern Minnesota Fair, and they took first as well as Sweepstakes cockerel, and special prize for the best egg type.

WINFIELD L. GOULD.

NEVER SAW A BETTER BIRD

Baltimore, Md., Sept. 22, 1922.

Dear Sir: I am taking the opportunity to write you and thank you for the interest you have taken in me. Received the cockerel according to your promise and a better bird I have never seen. I am glad to know you and I want you to know that I thank you for your splendid selection, and the promptness in answering my order. If there is anything that I can do in the poultry field, you can rest assured that I will always boost Oak Dale Farm and its manager, Harry M. Lamon, for courtesy, promptness and quality stock.

WALTER A. SOMMERS,

502 S. Bradford St.

Perfection . . . then Harry
M. Lamon is perfecting
Perfection.**

BIRDS SHOW SCIENTIFIC BREEDING

82 Lansdowne St., Peterboro, Ont., Can.

Dear Sir: The birds arrived today in A1 condition. The way they hopped out of their crates so full of vim and go, after a journey of approximately 1500 miles during this hot weather was ample evidence of their state of health. The striking resemblance that those birds bear to one another, makes one wish he could only see your whole flock. They certainly bear the ear-marks of scientific breeding. The value of such birds for a beginner in building up a flock, can hardly be estimated in dollars and cents. I wish to thank you heartily for the excellent value you have given me and the care used in selecting males to overcome defects in my own flock.

JNO. H. DAVIS.

ROUP?

You know the symptoms—face swollen, running at eyes and nose, comb pale, whistleer sneeze when breathing—catarrhal odor—that's ROUP.

STOP IT QUICK WITH

Conkey's ROUP REMEDY

Just put it in the drinking water. Chickens doctor themselves. It kills the Roup germs and saves the fowl. Equally important as a preventive, for it keeps Roup from getting a start.

Sold by dealers everywhere.

Conkey's Poultry Tonic

Keeps Hens Healthy—Gels Winter Eggs

It is a Regulator, Laying Tonic, Moulting Powder and Chick Conditioner of the highest type. No cayenne pepper—No filler. It pays to buy it by the pair.

Conkey's Poultry Book is well worth 50 cents to anyone who keeps chickens. Sent for 6 cents in stamps.

The G. E. Conkey Co.
6531 Broadway
CLEVELAND, OHIO

"Don't Worry! Conkey Will Cure Me!"

33% More Eggs

GREATER VITALITY---BETTER HEALTH

Highly essential minerals that have been overlooked in the usual ration make Murphy's Mineral Feed a real record-breaking egg producer. It will give your hens more "pep" than you ever saw in hens before. Adequate minerals are required for big production. Give your hens enough mineral and they will surprise you with better health and more eggs.

MURPHY'S FORMULA MINERAL FEED

It is not a medicine nor a tonic, but a feed that keeps hens healthy. It combines all the vitally necessary food elements for growth, health, production and reproduction, not found in the usual ration. We guarantee results. Trial order 10 lbs. enough to mix with 200 pounds of mash, \$1.00 F. O. B. Delavan. Order today. Literature on request.

MURPHY PRODUCTS CO.

New Poultry Disease Book

We are in receipt of a copy of the third edition of "Poultry Diseases," by B. F. Kaupp, Pathologist at the North Carolina Experiment Station. This book was written for veterinary students and practitioners, but is a valuable treatise and hand book for poultrymen, containing in plain language the symptoms, cause, conditions found upon post-mortem examination and treatment of each poultry disease. The work contains 340 pages, well illustrated. Price \$2.75. The book can be purchased from the subscription department of American Poultry Journal.—Advertisement.

J. S. PENNINGTON, Box A, Plainfield, Ill.

full of nice straight shoots. Can I start little ones from it, and how, and time of year?

Would like to buy a big rough acreage, not farther from Pittsburgh than Bedford Co., and in the state of Pennsylvania with some good ground to cultivate and containing plenty of building stone and some timber, just a place to go to and have some fun and get a place that if I got interested in it I could make into "some place." Do you know anything of the mountain valleys south of Bedford, Pa.?

Pennsylvania. DR. K. F. WHEELER.

You can plant catawba tree seeds in the ground in the fall. When the trees are two years old transplant them to where they are to remain permanently.

Cuttings from a Rose of Sharon bush can be taken from the bush late in the fall and healed in during the winter and planted in the spring. Unless you want to thus handle these cuttings from tree and bush, "for the fun of doing it" I advise you to buy trees and bushes of a nurseryman.

I can not refer you to any individual piece of land such as you desire in Bedford County. The location is good and there are some very choice apple lands in that county.

* * *

Answer to R. C. Rudd, North Dakota: Patton's Greening apple tree is remarkably hardy and will withstand the winters of your state without injury. I advise you to plant the variety, together with Duchess and Malinda.

* * *

Mrs. Florence Forbes, of Alabama, has purchased acreage south of Miami, Florida, and will plant an Avacoda pear grove. Practically all the poultry men and women of the United States will wish Mrs. Forbes full measure of success in this venture. Mrs. Forbes has rendered a great and valuable service to the poultry industry of this country, and is the best known poultry woman in the nation.

THE MOLTING PERIOD

The annual molt of adult fowls takes place in the late summer or early autumn. The discarding of the broken and weather-worn garments and the replacing of them by the new and beautiful are Nature's tribute to keep in repair what age had deprived of bloom and threatened with decay. That the change of dress should be timed so that the new, the warm, the beautiful, should be at its best on the approach of winter is evidence of Nature's kindly guiding. Man now and again has tried his hand on improving the time of molt. By methods of feeding and housing he has forced an early molt with the view of getting the fowls into lay in the early winter. By feeding on scanty fare, and depriving the fowls of green food, and at the same time confining them in warm quarters, an earlier molt was secured, but those who have tried and succeeded are not agreed as to the advantage gained. The rule is pretty general that the hens take their own time on recommencing to lay.

The discarding of the dead feathers and simultaneously the growth of the new, sometimes takes place so gradually and imperceptibly as to be unnoticed, save to the discerning eye that distinguishes the beauty of the new from the weathered condition of the old, writes W. K., in Scottish Poultry News. Fowls that doff the old and don the new in this way are worth watching and worth keeping. It is evidence of their constitutional vigor, and what is still more in their favor, they frequently continue to lay right through the molting period. These are the stamp of fowls to be used as breeders, combining as they do the bred-to-lay instinct with good stamina.

It rests with the poultry-keeper whether fowls enter the molting stage under fa-

vored conditions or with a handicap. The conditions to be favored are—absolute freedom from parasites and the insects that prey upon poultry; also freedom from an over-fat condition, and no less from over-cleanness. At no time are parasites so weakening to poultry as during the period of their molt. The growth of feathers is sufficient tax for a fowl, and the super-tax of feeding blood-sucking insects prepares for a collapse.

It is noticeable that young hens, as a rule, enter upon their molt earlier than old ones, and that they complete it in shorter time. This indicates their greater vigor. Instances occur of hens continuing to lay and showing no signs of molt up to late in the molting season, and then shed their feathers so profusely that they become all but naked and frequently collapse. In such instances they should be put into comfortable quarters and supplied with abundant nutritious food. Sulphur conduces to growth of feathers, and linsed is heat-producing, and given cooked or uncooked in small quantities it will prove helpful to fowls that show weakness whilst molting.

It is well to have all the adult stock fully through the molt by the end of September, or beginning of October, and to secure this those that unduly delay shedding their feathers should have the process hastened by the means already mentioned. As the autumn sets in, and the nights become longer and colder, care is needed of fowls passing through the molt and consequently scanty of clothing.

At this stage, too, if the fowls are running at large, there is need of shelter. Movable shelters of inexpensive material should have a place where poultry are kept in the open. They will more than repay their cost. Poultry are well nigh as sensitive to atmospheric conditions as is the barometer; specially does this apply to the period of molt.

The time of hatching has some influence on the time of breeding. The early hatched tend to early molt. Fowls generally molt somewhat earlier than fowls did formerly, and this is usually accounted for by the modern hatching being largely carried out earlier in the year than was formerly customary. The incubator has superseded the broody hen in hatching for early chicks, and making it an easy matter to have pullets in full lay in the late autumn and throughout the winter.

The influence of food upon the plumage has for long been known. It is to some extent put into practice in the feeding of certain varieties of poultry bred for exhibition, and buff colored poultry in particular. The feeding process for color is sedulously carried out during the molting period. In the breeding of cage birds, especially canaries, the practice is common.

Foodstuffs not only influence the color of the plumage. The character of the food given during the period of molting, and the growth of the new plumage, influences the quality and quantity of the plumage as well as its color. The niceties of feeding for color, for hard feather, for soft and abundant feather, may be regarded as a fine art, and all are dependent on the growth of the feathers upon the molt.

It is highly desirable to clear off molted feathers from house and runs. Their presence detracts from the appearance, and there is much to be gained by a tidy poultry yard. If the feathers are allowed to accumulate they present not only an unsightly appearance, but they offer an incentive to the poultry to become feather eaters—a noxious habit, too common.

The food conducive to molt has been mentioned, but once the old plumage is shed a more liberal flesh forming food becomes needful. It is needed to provide for the growth of the new plumage and to bring them on to lay at earliest. In the early stage of the molt poultry are listless and show a disregard for food. With the growth of the new, they develop a keen appetite, and if starchy foods are freely given an over-fat condition is pretty sure to follow. A 10 per cent of fish or flesh in some form will provide the raw material for the production of eggs, and if the fowls are of the bred-to-lay stamp they may be counted on giving a good egg return to compensate for the cost and trouble they have incurred.

WILL IT PAY?

The first question one asks when contemplating the poultry industry is, "Will it pay?" There have been neighbors all around who have kept hens and have concluded that it is a losing proposition; and then friend So-and-So tried it out on a large scale and lost all the money he had. "Does it really pay?" they ask. "Can't we buy our eggs and fry at the store of our neighbors and come out ahead in the long run?"

To be perfectly honest, I will have to admit there are two sides to this question. It may be answered both in the negative and the affirmative. It does not pay—for many people. Neither would any other enterprise, wholly neglected, pay. A lot of folks decide to get some hens. They go out and pick up the first flock they find for sale, never once inquire into the laying qualities of the hens in question, take them home and turn them out into a small, barren run, give them an old piano box for shelter, or a dirty, poorly ventilated, under-size hen house, dump in a little corn twice a day, and go out in the evening with a market basket to gather the eggs—and find none. No wonder! No, for such people hens do not pay.

A young clerk once took the "hen fever." He had seen some very fine fowls at a poultry show. They took his eye. How easy to produce chickens like that! In order to start right he purchased the finest standard bred hen he could find with a brood of fifteen fine chicks. He proudly paid a long price and took his fancy specimens home. The next day one little chick toppled over and died. The next day three or four died. The third day he lost some more, and by the fourth or fifth day he had nothing but a fussy old hen left. Convinced that he had purchased diseased stock, he hastened back to the man who had sold him the birds. "Fraud!" he cried. "They must have been sick when I got them." "What have you been feeding them?" asked the poultryman. "Feeding them?" repeated the tenderfoot in amazement, "why, I thought they sucked."

That is about as much as some people know about poultry, and then expect the hens to turn in a full basket of eggs every evening. But hens, properly cared for and properly selected, will pay. Thousands will testify to that. Give the hens a chance. Give them clean quarters and a roomy house well ventilated and free from drafts, give them a good balanced ration, plenty of green stuff, and all-day exercise, and if they are hens they will lay. Observe these few rules, and there will be no more talk about biddy's unprofitableness:

1. Clean, dry, well-ventilated houses, with plenty of floor space.
2. Plenty of grain in deep litter, dry mash always, grit and shell.
3. Plenty of sprouted oats or other green feed, and a little meat.
4. Every hen free from lice and mites always.
5. All hens kept in out of cold and stormy weather.

I could quote the names of numerous people who have observed these simple rules, and every one of them will tell you that hens do pay. A near neighbor, an old lady, cleared more than \$60 during the winter months from only a small back-yard flock, and she got fun out of it besides! But some of her neighbors whose chickens roosted in the trees or on the fence were crying, "It doesn't pay!"

A friend of mine bought ten acres of bare ground some little distance from the city. He had no money. He simply promised to buy the place. He left his family in the city and walked out to the "ranch" because he had no money to pay car fare. He managed to get a few hens. He built a small hen house. He took care of the hens, and they showed their gratitude by laying nice white eggs, and lots of them. He got more hens. He built more houses. He made a first payment on his place. He continued to thrive, and at the end of eight years I visited his place. Presto, change! He had 4,000 laying hens, many up-to-date laying houses, brooder houses, colony houses, and everything that goes with a prosperous poultry plant. He had built a good modern house on the ranch, had a splendid barn, rode in a new flivver, and was looking the whole world in the face, for he owed not any man. And the music those 4,000 hens made. It was harmony in the ears of any man who cared for a good free life, independent from all the cares and ills of the pavements.

Nebraska.

BADGER VETERINARY REMEDY CO.

885 17st. Milwaukee, Wis

LONDON DAIRY SHOW

By Edward C. Ash

On Oct. 17th at the Agriculture Hall, London, England, the classic show opened for the 44th time, and, as usual, the stairway leading to the poultry section had a crowd on it at 12 o'clock waiting for the hour of 1, when the public would be admitted. The dates of the dairy show were Oct. 17 to 20, 1922.

There was a time when poultry was merely a side line of this intensive and extensive show. Today, it is perhaps the most important feature. Huge crowds find their way up there and the spaces between the cages are congested with interested breeders and would-be breeders. This year the poultry exhibited were, on the whole, of surprising merit, and one found there magnificent specimens of all breeds, from the oldest and most established to the latest innovations. To win at this show is indeed an honor, for the judges are very carefully chosen and the competition is keen. It is a meeting of all the giants in the poultry world and is one of the final reckonings of the season.

Rhode Island Reds were in great force, but they did not show quite the quality of last year. Many of the cock birds were ticked with black in hackle, and pullets' light hackles were too frequent to pass unnoticed. Curiously enough, one of the best Rhode Island Red pullets in the show itself, a fine shaped bird and red to the very skin, was first in the selling class. Great excitement followed, for 3 pounds was its price, and many a breeder slipped quietly away to claim it. It then came into the auction and made £28. Mr. H. J. Lewis of Field House, Shardlow, near Derby, was the breeder. If every R. I. R. man saw this bird and if Mr. Lewis has pens of such quality as exhibited in the selling class, a special train service will be required next season to cope with the demand. Mr. Lewis also had cards in the open classes, and, considering the numbers exhibited, these were well worth having, although not from a monetary point of view. There were 105 in one class. In S. C. pullet class there were 135, Miss Clay taking the first prize and the gold medal. The R. C. classes were below the 30, which shows how much more popular are the single combs. A further stir in R. I. R. circles was caused by the disqualification of a S. C. cockerel for alleged dyeing. In my opinion the R. I. R. classes missed the brilliancy of sheen which is so important in every breed, but this failure may, of course, have been due to weather conditions rather than to the birds themselves.

Leaving the Rhodes, which, by the way, took some leaving, the next cages are of Russian Orloffs, the curious nob-combed fowls which for some time appeared to be making great headway. I was very disappointed with the Orloff classes. They were nice birds, that was all one could say. They lacked feather, color and condition, and, in my opinion, they were not as good as those exhibited last year. The Ancona classes were full and fair, although the first and third prize cockerels hardly seemed to merit their honors. The pullets, however, were better, and the first prize bird in a class of 59, the property of Mr. Hartley, was a perfect wonder. Beautifully mottled, and of a lovely color, she is, although failing in leg color, one of the prettiest pullets I've seen for a long time. She was certainly a long way ahead of any other present. It was a very class indeed, and vying with the genuine Anconas were birds that would have won in a village show. A wild, long-legged creature, failing in color and with tail trying to touch the sky, was far too frequent in this class. British Ancona breeders will have to wake up. Last year's Palace show was far ahead of this!

Close to the Anconas were the Frizzles, which caused the uninitiated visitor to be facetious about curling irons and curl papers, and, indeed, as far as he was concerned, might have been labeled "puzzles." It is certainly a weird variety in which so many colors can be classed together on account of a curling feather. Anyway the exhibits

were a good attempt, one class having 14 entries, and on the whole there was plenty of size and good curl and shape. Sir Claud Alexander, Bart., won first and second prizes, and the judging was good.

Sussex classes were huge, well filled and good. Moreover, they showed a speeding up of type. In other years they have been all shapes and of all kinds and conditions. This year most of them might have been brothers, so alike were they from a casual glance. They were all big, upstanding birds, too. Mr. Barchard won first prize with a very useful bird of great size in the light cockerels class of 64. In the light pullets (103 entries) the first and second winners seemed to me wrongly given. Both were birds far too small, although good in plumage. Many of the other pullets which were far better had apparently been passed unnoticed.

In the Red Sussex I came across one of the most perfect pullets I have ever seen. She was first, and was the property of Messrs. Campkin and Glenny. Here was perfect shape and color, and such undercolor, too! Fortunately for the owners, I am honest, and am not a Sussex breeder just at present. The second prize bird was good, but not quite in show form. Red Sussex cocks were also greatly improved and there were some magnificent birds shown. The birds were long and deep, typical Sussex of the deepest red, a breed with great possibilities here. The Speckled Sussex did not appear to be as good as in former years.

In the breeding and selling classes the new Buff Sussex, a curious and useful bird, of more or less Sussex shape, caused some interest, the breeding pen standing at £1,000, drew no bids. I doubt if they will make headway, since already there are too many buff heavy breeds about, even at such low prices!

In Leghorns, the Brown classes were simply magnificent, the rich coloring of the cocks being better and clearer than ever, and the hens being perfect. I foresee a fresh impetus in the Brown Leghorn fancy here. The White classes, as usual, were huge birds, Lord Dewar taking first and second in cockerels. In pullets the 1st, 2nd, 3rd and Reserve were all taken by H. and A. Derbyshire—a wonderful achievement, and a grand lot of birds in a good class of seventeen. Black cockerels were not very strong as a class and were not very good either. But the pullet class of 33 contained some very nice birds. In the A. O. C. class gold and silver duckwings, buff piles reappeared. Will they ever be popular again? I doubt it, although attempts are being made to revive this breed.

Minorcas, once so popular, seem to be falling fast in the public esteem. The Dairy Show classes were small, and the birds huge, ungainly monstrosities. What a pity to ruin so fine a breed! I was glad to get away from these classes and eager to get to the Andalusians, here again to be disappointed. Whilst the lacing has improved and the color became clearer, the breeders seem to have been out for more size and length of leg. It will be a great pity if the Andalusian loses utility to get mere increased size.

The Plymouth Rock classes were very strong, and among the barred classes were some remarkably fine pullets, well barred and of a clean color. The first, second and third birds were the best pullets I have ever seen, and of the three I liked Mr. Taylor's bird, the third, best, as it had more size than the first. I think the Barred Rocks have made astonishing progress. Buff Rocks were also exceptionally good, especially the cockerels, which had great size and were best in color and had plenty of bone. In the A. O. C. class several useful whites were shown.

Faverolles were only fair; we have not got the birds of Betts's day—they were Faverolles then. At the Dairy they had neither the color nor the feather and were disappointing. It is a good breed and well worth keeping.

Wyandottes were a great show. I noted an improvement in the Blacks and the Columbians, while the quality of the Whites was excellent. But the Silvers and the

THOMAS' PARTRIDGE WYANDOTTES
Detroit National Winners
P. E. THOMAS. Box A. FAYETTE, OHIO

Partridge were below standard and the Golds only fair.

The Sicilian Buttercups want breeding up. These ought to be rich, golden birds. The cockerels were very beautiful indeed, but the pullets were too much like brown Leghorns. A weird assemblage of combs, especially on the pullets—a very few good, the rest bad.

From the Buttercups one came to the Silkies. Whilst well shown and good, the various colors were rather feeble. One I noticed which might have been brown in color had a red comb, and a white skin and was somewhat like a Silkie in feather. What could it have been?

The Indian game classes were good, as usual. There was great width, light feathering, grand colors, huge bones, and such weight! The cockerel of Northcott & Son, the widest bird I have seen, had grand shoulders, rich color, and was shown in perfect condition. Number 2 looked a child compared with him—not that the second prize bird was not also a topper, for he certainly was. In the pullets section Mr. Birch's first prize bird was one of the most remarkable pullets of the day.

The Old English Game was fair, although some very useful birds have seen better classes.

The Campine classes, one of the strongest entries of the show, were well filled, 125 birds being exhibited, compared with 70 for last year. The quality and lacing has gone up. In the Silvers the first cockerel was a wonder, but had no barring on his tail. All the same, for top, breast, shape, size, and, last, but not least, hackle, he well deserved his place. Mr. Tomkins, the Rose Comb breeder, showed this bird. Mr. Tomkins appears to be an expert in single combs, too. In pullets, the second prize bird, exhibited by Mrs. Cooke, was a marvel, and the best Campine seen for years. Perhaps it is the best Campine so far evolved, but it failed on breast barring. The first prize bird had not the plumage, although more even in barring and perhaps with better breast. In golds, Lt. Col. Lucas, the well-known Campine enthusiast of Stowmarket, won with a magnificent gold cockerel.

I found the Orpingtons rather disappointing, except the black and buff cockerels, which were good. The Langshans and Coads were fair and the Cochins better than ever, although not a strong class. Nos. 1, 2, 3, Reserve, and V. H. C. in whites all went to Rev. Stevens, which was some win! Red Caps were poor.

The Brahmas this year are the best seen for a long time. Their color is clear and good and there are signs of a new life for this old breed. The Dorkings, too, are waking up. Very typical Silvers and Darks were of great length. There was no class for Marsh Daisies, but I hoped to find some of these interesting fowls in the A. O. V. or in the breeding pens; there were none, however.

The breeding pens were interesting and contained several "new" breeds. But the markings of the Barnevelders—a useful breed—were not likely to cause a stir. Except for one cockerel, which was a real beauty, there was nothing of any importance. I saw Barnevelders some time ago at the egg laying trials and they were very different to the Dairy Show exhibits. My money will not go in Barnevelders until I find some more like those I saw on my first introduction to the breed. I will say nothing about the Gatinaises and it would be difficult to persuade me they are a true breed. If they are "they ain't much cop." The Noires du Berry are a better proposition, but nothing to scream about. Close to them were Black La Bresse and Grey La Bresse, both very nice, indeed, perfect hens. These are breeds with prospects, although one is inclined to call them just Campines without the bars. The gold medal for the best bird in the show was taken by Mr. C. N. Good with a White Wyandotte cockerel, a Buff Cochin (Mr. G. H. Proctor's), standing Reserve for this, the highest honor in the show, and one exceedingly difficult to award.

The duck classes were well filled and the Aylesburys were better than ever, being huge ducks with great length. The Rouens, one of the best ducks we have, are hard to beat,

and there were some exceptionally useful birds of this variety at the show. The Indian Runner classes were large and well filled, and the birds were of excellent shape and carriage. The Blacks appear to be making great headway and are certainly very handsome.

The Orpington ducks do not show any marked improvement, while the Buffs are getting more popular than the Blues.

In the A. O. V. class a huge Pekin duck drew attention. The crested ducks, which appear to have Muscovy blood in their veins, are not very attractive. Their color is poor and the crest too much of a "mop on anyhow" to become popular, except as interesting curios.

In the selling class the Cayuga showed up well, a duck perfectly magnificent in color and shape. A Cayuga the size of an Aylesbury would be the ideal duck; perhaps we shall see this some day?

The geese were nothing out of the ordinary. A useful lot of birds, perhaps. The Toulouse geese wanted depth of gullet, although they had good color. This failure of gullet, so typical in the geese, can not, however, be made up by plumage. In Embden geese the Willowmere Poultry Farm showed a remarkably fine bird, although perhaps a little narrow.

Turkeys were in Bronze strength in the A. O. C. class. The two white classes showed fair birds of this variety, but the Bronze in the A. O. V. class appeared to me to be the turkey.

In the Bantam classes there was a really good show of birds in great condition. The only remarkable thing which drew my attention were the two golden Campine Bantams exhibited by Mr. E. Cobb, for the first time. They are a good start and are perfect Campines, although not small enough. A golden and a silver Campine bantam would take a lot of beating, and I am looking forward to the day when they will appear about the size of the Birchin Game Bantams.

Summing up the show, I should say that the finest poultry ever seen in this country were on view at the Dairy Show. They were all shown well, and except for the classes mentioned where live birds appeared, we can take it that the L. D. S. of 1922 will be remembered as an exhibition of the acme of the breeder's art, and as showing a general improvement of stock, especially in the older breeds.

In the A. O. V. classes an occasional Poland, a Sultan or two and also some Hamburgs appeared. Only 6 Hamburgs! and once upon a time the Hamburg was a popular breed. A few Creve-coeur and a new breed of Buff Medway (a Buff Orpington crossed Faverolle, if I guess right) were there, too. These A. O. V. classes appear to me to be the last ditch of many a variety and the birth of a few and offer a specimen box for the new ideas in poultry. Each year "summat" else comes in, often birds with no chance whatever, to appear once and to be never heard of again.

Sales at the show were good. Two Indian Game cockerels sold for £50 each. Light Sussex cockerels for £30, £15 and £13; White Wyandotte pullets for £25; R. I. R. pullets for £28 and £20. The highest price for a duck was £10 10d. 10 s., an Indian Runner making this money. Over £1,000 worth of poultry changed hands.

The Other Fellow

When you buy or sell poultry in any of the forms, such as stock, baby chicks or hatching eggs—do you look at the transaction as nearly as possible from the other fellow's viewpoint?

Do you expect him to send you better value for the money than you would send him if the sale were reversed?

Do you ship him the very best you can for the money, or do you ship him what you would not care to use for your own breeding?

Do you feel like calling the other fellow a robber if you do not receive a \$10 bird when you send a \$5 bill?

Do you?

THOUSANDS OF WINNERS

At our Leading Shows are annually conditioned with

NU-LIFE PILLS or TONIC ::

Successful Fanciers give each bird a pill before and after washing for exhibition, before and after shipping and to all birds that are suffering from Going Light, Bowel Trouble, Roup or any run down condition.

The above cut illustrates our Sanitape method of Packing Tablets. Each tablet retains its strength until used.

NU-LIFE REMEDIES are prepared under the personal supervision of D. D. Whitaker, a Life-long Poultryman, Expert Conditioner and Licensed A. P. A. Judge. If you have trouble in your flock, write Mr. Whitaker. His advice is free and is cheerfully given.

Nu-Life Conditioning Pills.....30c and \$1.00

Nu-Life Conditioning Tonic (Powder form).....25c and.....50c

Nu-Life Germicide Tablets (for Roup and Canker).....50c

Nu-Life White Diarrhoea Tablets (for baby chicks).....50c

Satisfaction guaranteed or money refunded

NU-LIFE REMEDIES are sold by all leading dealers. If for any reason your dealer cannot supply you, your order will have our prompt attention. Write for free circular on Poultry Diseases.

DO NOT CROWD THE LAYERS

It is quite a job to hatch and raise a bunch of chicks, but to work hard running incubators and brooders, cleaning houses and runs, keeping the right kind of feed, water, grit, and charcoal before them, greasing, dusting and spraying to keep down lice and mites, culling out surplus cockerels and weakly, objectionable pullets to give the better ones a better chance; and then after all, to move them to winter quarters too early and crowd them just a little too much before the hot summer nights are over and have them take colds and roup—is certainly discouraging.

From past experiences let me warn you not to move those pullets to winter quarters and overcrowd them day and night if you do not want roup. Let the pullets stay on the range until the nights get cool and pleasant before moving them to their winter laying quarters where they will have to be confined to the house and probably a small run for some time to break them from their old roosting place.

Pullets should not be put on a laying ration until they have attained full growth and development. And if they have the size and age to begin laying, it is best to try and hold them back a few weeks, for if they start laying too early in the season they will lay from thirty to sixty days and stop for a molt, which may last about all winter. I saw this tried by a poultryman last year.

Some poultrymen get in a big hurry and a stew when eggs begin to go up and, putting their pullets in the winter laying house, begin at once to feed heavily on egg-producing food before the pullets are old or large enough—just because eggs are going up. Such work as this does not pay.

If you want good-sized pullets that will lay all winter and be worth something to you later as breeders, let them get their growth and be old enough to lay before you begin to house and feed for eggs.

When you think they are large and old enough and the hottest weather is over, move them. But be sure your house is well cleaned and disinfected and that there are no mites in it. Also go over the pullets with sodium fluoride, either dipping or by the pinch method. Next see that each pullet is free from any touch of cold or roup and last, but not by any means least, don't overcrowd. Give them plenty of room and be sure they get plenty of fresh air, but not a draft.

Then see that they have plenty of good, clean litter on the floor to induce exercise. Place grit, oyster shell and charcoal where they can get it and keep plenty of clean, fresh water in clean containers before them at all times. Then gradually change from the growing to the laying feeds. But not all at once.

Don't put the pullets with old hens, as the old hens will not let the pullets feel at home; and the old hens need a different feed than the pullets. A pullet needs a more fattening ration than an old hen.

After all this is done be sure to keep

the scratch pen and dropping boards clean. Do not let them scratch in filthy litter, and especially see that there are no leaks in roof of house, for wet litter is worse than dirty litter.

Then be gentle and quiet when feeding the pullets and make them feel happy and that nobody is going to harm them. Also fix good, roomy nests with nice, clean nest eggs in them, and pretty soon they will get to business and stay that way throughout the year.

Tenn.

S. S. Surret.

PUREBRED STOCK

The keynote of all business today is efficiency, the high cost of production, whether it be a manufactured article, or the growing of crops and live stock, has reached a point where all waste or lost motion must be brought down to the lowest possible minimum, or the business will most probably be running at a loss. Large mercantile concerns know the value of efficiency, so much so that many employ efficiency experts who come in and overhaul the entire management, throw out the men who are pulling down big salaries and giving no returns, and in many cases getting as much, or more, work from 50 to 60 per cent the former staff. This movement for greater efficiency should apply to the farmer perhaps even to a greater extent than to the merchant, for therein lies the source and heart of most of the farmer's troubles.

If the same amount of efficiency were obtained on the farm as is secured in most successful business concerns and applied to every branch of the farmer's work, the day would soon come that would bring the farmer into his own.

Let us go into the matter of efficiency in one branch of the farmer's work, a source of revenue to every farm in the country, and yet how few realize what an important part it plays and how greater efficiency would more than double his income. I refer to a modest hen; give her a little thought and attention and keep a separate account of the returns you get from your flock of fowls and you will be surprised at the results.

The first step in efficiency of the farm flock is to breed Standardbred, which means purebred stock. Why? Let us run over some of the advantages of purebred stock; with the hope that it may impress upon all farmers the wisdom of keeping only purebred poultry.

First—There is far more reliability in the breeding of purebred stock than can possibly be had by using mongrels. A purebred flock of any standard breed having been purely bred for many generations with a specific object in view, either meat, eggs or dual purpose, will reproduce their kind with an unfailing certainty. This strong hereditary tendency of one type, due to many years of straight breeding, is not found in crossbreeds or mixed flocks.

Second—Then there is greater uniformity in the product produced, whether it be eggs or meat; purebred

These Books by Well Known Authorities Are Now Yours

Tells all about the great American poultry industry: Origin of domestic fowls, magnitude of the industry, tables showing the numbers and kinds of fowls raised in different states. **Analysis of Standard Breeds:** Description of each variety, including sixty pen drawings of ideal types by a leading poultry artist. **Companions of the Hen:** Special chapters on ducks, geese, turkeys, guinea fowls, and pigeons. **Incubation and Brooding:** Natural and artificial methods, How to choose equipment, incubation and management, selection of hatching eggs, fertility, baby chick industry, setting hens, testing eggs. **Poultry House Construction:** Designs for all kinds of buildings, laying houses, colony houses, brood coops. **Feeding:** Analysis of foodstuffs of every description, how to compound rations. **Diseases:** Symptoms and causes of all common ailments, remedies, white diarrhea, worms and vermin. **Breeding:** Increased egg production, selecting males, trapping pedigree breeding, marking fowls. Price postpaid. **\$3.00**

Mating and Breeding of Poultry: 340 pages of how to mate and breed all Standard varieties of chickens, based on the experiences of eighty-one leading American breeders, who tell them to produce in full perfection every breed described in the Standard. Fully illustrated with ideal birds and feather charts. Following are a few of the subjects: Linebreeding, Inbreeding, Variation, Influence of Sire and Dam; Control of Sex, Prepotency, Mendelism, Selection of Vigor, Introducing New Blood, Single Mating, Double Mating, A Fixed Plan of Breeding, Establishment of Blood Lines. Breeding Birds with Defects, Pedigreeing, Alternating Males, Age of Breeders, Record of Matings, Size of Mating, Breeding Condition, Culling, How High Egg Producing Ability Is Inherited, Breeding from an Untrapped Flock, Breeding from Trapped Stock, How to Mate every variety in the standard. 340 pages cloth bound, profusely illustrated. Price, postpaid. **\$2.50**

Explains how to condition birds. The time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. In legitimate show preparation what chance have you to win over one or more of your competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment. Well this is not that kind of a book. Price, postpaid. **\$2.00**

Interesting and authentic. Up-to-date in all particulars, 256 pages, 100 illustrations. Printed on enameled paper. Bound in brown cloth.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and each step in their development. Only a few of the general subjects are: Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualification of a breeder; Work of the breeder; Building a strain; Inbreeding, Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting. Price postpaid. **\$2.00**

999 QUESTIONS AND ANSWERS

124 pages. No matter what question arises, this book gives the answer in a few words. Questions for the fancier; about feeding, correct rearing of chicks, what and how to build, diseases, incubation, breeding turkeys, ducks, geese, etc.

American Poultry Journal Pub. Co.
623 Plymouth Court, Chicago, Illinois

birds produce greater uniformity in eggs as to size and color and shape; all of which makes the eggs bring a better price. Just glance at the commodity prices in our daily papers and note the great gulf between the prices quoted for gathered mixed eggs, and fancy browns or fancy whites.

It also greatly improves the quality of the meat, the flesh is superior in texture and quality, making it much more tender when cooked. Without a doubt, purebred birds of the meat breeds are superior to mongrels as table fowls.

Third—More eggs. That is what we all look for. Experience proves the assertion that purebred poultry represented by the breeds which have been bred for egg production for many generations, will lay a larger number of eggs than will birds of mixed breeding. They have been bred so that all the food which does not go to body maintenance will go to making eggs, and lots of them, and not toward flesh growth. Look at the proof of this as shown by the egg-laying contests conducted all over the country and in foreign lands.

Fourth—It costs no more to feed purebred poultry than a flock of mongrels. Therein lies greater efficiency from feeding; not only because it costs no more to feed purebred birds, but because the feed consumed by purebred birds will go to make a better product, according to the type selected by the breeder, best suited to his purpose, as eggs, or as meat.

Fifth—Demand for breeding stock: If you keep purebred birds you will find an ever-increasing demand for your stock and eggs, which will greatly add to your profits from your flock. Remember the best stock you can buy is none too good, and the better your stock is, the greater will be the demand for it. People will soon see that it paid you to discard your mongrel flock, and they will want to do likewise. Stick, however, to a popular breed, best suited to your needs, and don't be led off by spectacular claims for some new and untried breed; the breed which is taken up today and discarded tomorrow is not a popular breed in any sense. In selecting your breed remember your probable customers and cater to their wants as far as possible, the majority will always want breeds which have proved themselves to be the best payers.

Sixth—Last on our list but by no means least. More pleasing to the eye. Everyone loves to see the beautiful, and certainly a flock of birds all one color, size and shape is more pleasing in appearance than a flock of mongrels. We all take more care of those things we are proud of, it's human nature to do so; our work with them excites our enthusiasm and instead of a drudgery chore, it becomes a pleasurable pastime. Get a flock of purebred birds around you, and you will have something worth while and something to be proud of.

The purebred flock has come to the American farm for all time. It has been shown in all parts of the country that for no purpose do mongrels produce better results or return a greater revenue. The first step toward great-

er efficiency with the farm flock is to start with and maintain purebred birds; it matters little what breed you choose, select the one best suited to your purpose, having decided on that, then be sure to secure a good strain.

The breed does not signify everything, different strains of the same breeds vary vastly. Get a strain that you have every reason to believe has been rigidly selected for the purpose you desire; better have 10 really good birds than 20 of questionable strain. Follow up the work of the breeder from whom you get your stock by very careful selection in your own breeding operations, and greater profits will be your reward.

Let efficiency be your motto with your farm flock as well as in all your other branches of agricultural endeavors. Va. H. E. Rouse.

THE OLD DOMINIQUE

Wife and our 12-month-old baby made up our entire family living in edge of the city of K—, with an extra lot for garden and a small chicken house and 40x60 runway.

Of course we had to have some chickens, as we both had been reared on the farm, and the city could not possibly seem like home without fowls of some kind.

Wife, baby and I held a conference and after considerable discussion I was appointed a committee of one to see our local dealer.

I went and found he had about one hundred fowls which he had bought from farmers to put on the market.

I selected a half dozen of hens, proudly carried them home and put them in our chicken yard.

The purchase consisted of two Rhode Island Reds and three black mongrels, and one American Dominique and imagine my surprise the next day when hearing a nice, gentle cackle on going out to the coop I found a nice, white-shelled egg, our Dominique running and cackling so proud.

Well, right then and there I named her Biddy. She was so gentle she would eat out of my hands.

This was in the fall of 1918. Our Biddy continued to lay right straight on through the winter. Our other hens never laid one egg. Wife never did like eggs; but baby and I made up for default on that line, and three days out of the week we had a breakfast of real, fresh eggs.

The five hens which refused to work were one by one put on the block and made into chicken potpie.

Well, old Biddy settled the breed selection for me right then and there in favor of the American Dominique.

Their ability to produce white-shelled eggs during the winter months, their gentle disposition, beautiful plumage, rose comb and yellow skin! I can't see why they are not the peer of all breeds. Thrifty, energetic, beautiful and docile.

They can and do lay the eggs. Hardy, easy to raise and as a table fowl unsurpassed.

They are 100 per cent profitable. I don't believe there is any breed of fowls on earth that surpass our American Dominiques. Kirby Riggs.

AMERICAN DOMINIQUE

Editor—American Poultry Journal:

"We have read with interest your denunciation of the American Dominique in the November issue of the A. P. J.

"The barring requirements for the Dominique are quite as definite as for any other barred fowl. There is just as much underbarring called for as in the case of the Barred Plymouth Rock.

"You state that 'the barring of the Dominique can be easily produced and is to be found on thousands of dunghill fowls all over the country.' To a true fancier or even a poultry raiser of experience there is a vast difference between a true Dominique and a common scrub. Any person who cannot tell the difference at a glance could hardly claim to know anything about Standard Bred Poultry as a whole.

"We gladly admit the Dominique is built for egg production and that she fulfills every desire in this line. We also are happy to state that this breed has the qualifications to meet the criticisms advanced against the overbred classes which are bred for beauty of feather above every other consideration.

"The statement that 'not over \$500 worth of Dominiques change hands in a year' comes as the biggest surprise of all. In the small city of Columbus, Wisconsin, population 2500, well over \$500 worth of Dominiques are bought

and sold every year. If this city is the biggest producer of Dominiques in the United States we would be glad to have an authorized statement to this effect. It should have great advertising value.

"At the Columbus (Wis.) Poultry Show, January, 1922, 40 Dominiques were cooped; 10% of all the birds exhibited. Dominiques won First Pen and High Male in the Sweepstakes and the judge's comment was that they were among the best bred birds exhibited.

"Our opinion is that instead of the 'Dominique having no architect' they are so finely designed that only the cream of poultry fanciers can see their merits. Some paintings are beautiful only in the eye of the true connoisseur and the Dominique stands out in the same way in the eye of the true poultry fancier.

"There may be only a comparatively few Dominique breeders, but they are true blue. I have many breeding this grand old American Fowl for many years and expect to continue for many more. Three Cheers for the Dominique, she may wear plain feathers but she delivers the goods."

Wis.

W. F. GERNETZKY.

[Note: Evidently the author of the above is behind the times. The 1905 Standard called for underbarring in Dominiques, but both the 1910 and 1915 Standards have called for "Undercolor, slate."—F. L. P.]

FEEDING OF EPSOM SALTS

The Kentucky Experiment Station has been misinterpreted as recommending the feeding of "one ounce of epsom salts daily to each six hens." This is incorrect, since the Kentucky Agricultural Experiment Station has never recommended feeding epsom salts oftener than once each month or six weeks. The proper amount to feed is one pound per hundred hens, and the simplest way is to dissolve this amount in a gallon and a half of drinking water.

The results of two years' feeding tests at the Kentucky Experiment Station show that it is possible to secure high winter egg production without the use of green food when the birds receive sour skim milk, buttermilk, semi-solid buttermilk or meat scrap as a source of protein. Pens in these tests received epsom salts once each six weeks at the rate of one pound per one hundred hens.

Green food is usually fed for the succulence it furnishes. This succulence tends to cleanse out the digestive tract. Feeding the salts once every month or six weeks keeps the digestive tract well cleansed and thus avoids the necessity of green food for this purpose. Tests at other experiment stations have shown that the absence of green food reduces the fertility and hatchability in the eggs. Consequently, the salts should not be fed in lieu of the green food to breeding pens.—J. Holmes Martin, in charge Poultry Husbandry, Kentucky College of Agriculture.

Bigger Poultry Profits

Supply your chickens with clean, warm water—prevent disease, increase egg yields and save on feed.

Thermos Sanitary Chicken Waterer

will keep water warm at smallest cost. No heater—a vacuum retains the heat, same as in a thermos bottle. Also keeps water cool in summer. The only thermos chicken waterer that can be easily and quickly taken apart for cleaning. Two sizes—guaranteed.

BLACKHEAD IN TURKEYS

Mrs. Geo. Fitzpatrick, Michigan, writes:

"Can you tell me what causes my turkeys to have liver trouble? Their liver looks large and full of white spots, and there are green bunches full of pus. I have lost 5 this way and others seem drowsy. They only live two or three days after I notice them. They don't have any appetite and seem to sit by themselves away from the rest. They have free range, I feed shelled corn, mash mixed with sour milk which contains bran, middlings, corn meal and sometimes wheat and oats. Is there anything I can do to stop the rest from getting this liver complaint? Their heads become real dark when dead, but the others look natural and some have their eyes swollen like the roup but it does not smell as bad as roup. One died from it and I have several more that are affected the same way. What can I do for them? Have tried almost everything but they do not get well very fast."

C. E. Bird of the firm of Bird Brothers, Pennsylvania, replied to the above inquiry about blackhead in turkeys as follows:

"While it is nearly always quite difficult to diagnose sick turkeys without seeing them we feel sure that you are feeding your birds too concentrated ration as well as giving them too much of it. You state in your letter that your birds have free range and young turkeys on free range at this time of the year will need very little of any kind of feed except what they pick up from the stubble fields, etc. Great care must be exercised in the feeding of the young turkeys as cold weather approaches and they leave the range for the buildings. Along the first of November when the cold winds begin to blow the young birds will slow up their daily travels over the fields and seek some protected places around the buildings, and loaf for hours at a time, and if they are given too much feed they will surely get on the bum. They must be fed very little at first and increased gradually from time to time until you get them on a fattening ration.

"The young turkeys we raised on our farm this summer have been running in three bunches. The first two bunches which are the earliest hatched were given the best attention we knew how to give them. They were fed night and morning and housed every night until they were old enough to fly on trees to roost. For the past three months we have been giving them a grain mixture of equal parts of cracked corn, oats, and wheat. We consider this a very good ration for them while they are on free range but they must not be given all they will eat of this or they will have their digestive tract upset and eventually get liver trouble. Now, the third bunch of birds which were hatched from 4 to 5 weeks later, when the weather was warmer and insect life more plentiful, was not given much attention. When they were about 72 hours old we took the turkey hens with them up on a chestnut ridge used as a cattle and sheep range and turned them loose to take care of themselves to a great extent.

"We went up and fed these occasionally for the first week or two so as to give them a little start and keep them from roaming so far away. After they were three weeks old we did not give them any feed, in fact did not feed them all summer, and they are not now (Oct. 18) getting any feed. We had not personally seen these birds for two months until the other day and we surely were surprised when we saw them. They look so fine and vigorous and are actually as large or larger than those that are much older and have been given much better attention.

"We have mentioned the above methods of raising the young so as to show that feed has much to do with many of our turkey troubles.

"We would suggest that you keep your turkeys away from your chickens and farm buildings as much as possible and let them run on the range for more of their feed as long as they will."

W. E. Stanfield, poultry editor of Northwest Farmstead, recently remarked that blackhead was all too common in the great turkey growing region of the Northwest and he believed there was too liberal feeding of new corrl.

MORE EGGS BY ELECTRIC LIGHT

Although the use of electric lights in the poultry house does not greatly increase the total annual egg production of hens, says the United States Department of Agriculture, it does increase the yield during the winter months when the price is high and is therefore profitable. In experiments carried on by the department during the fall and winter of 1920 and 1921, lights were used from November 1 to March 20.

Each year a flock of 50 pullets was used. The first year, during the period when lights were used, the lighted pen produced 50 dozen more eggs than the same number of pullets in an unlighted house. The second year the pullets in the lighted pen layed more than 60 dozen eggs in excess of an unlighted flock of the same size and quality. One 75-watt light was used for the 50 pullets for 2½ hours daily for 140 days. It was turned on at 4:30 in the morning and allowed to run until daylight, being turned off by the poultryman when he came to work. It was turned on automatically by an alarm clock device.

An average length of day from 12 to 13 hours gives the best results. Adding the extra light in the morning is the most convenient method, although some poultrymen use lights both morning and evening. The hours added to the hens' working day should be the same in either case. Making the day longer than 13 hours forces the birds too much.

When lights are used in the evening some arrangement for dimming them is required

Cockerel heading first prize young pen White Plymouth Rocks at Boston, Jan., 1922. Owned by Sabrina Farm, Wellesley, Mass.

so that the hens will go to roost before they are turned out entirely.

When artificial lights are used the hens must be fed more. In fact, the object of the plan is to give the hens an opportunity to eat more, with the result that they will be forced to lay more eggs, providing they are of a laying strain. Dry mash should be available at all times, and scratch feed should be used in deep litter to make them exercise. A feed of grain should be put in the litter at night so that the hens can go to work as soon as the lights go on in the morning.

It is important to have plenty of fresh water handy so that the hens can get it whenever they are eating. In the winter when lights are turned on automatically in the morning some provision must be made to keep the water from freezing when it is kept in the house all night. The department uses an electric light with a carbon bulb immersed in the drinking water. The bulb is tightly covered with a piece of black cloth so no light is thrown into the pen.

As a general rule it is only profitable to use artificial lighting on pullets, and the best results are obtained on well-matured pullets. Hens to be used for breeders should not be forced for egg production with electric lights during the period just preceding the breeding season, as forced laying at that time is apt to cause poorer hatches and produce weaker chickens than would be obtained from hens kept under normal winter conditions.

Packers Buy Leghorns Cheap; Butchers Sell Them at High Prices

Editor American Poultry Journal:

"I have your letter with which you enclose a copy of the Price Current, New York City. This sheet bears out what I stated in my last letter, namely, that the word 'Leghorn' is used to the detriment of the breed by buyers of live poultry.

"On page 1, fourth column, there are twelve grades of fowls and chickens listed, three of which are quoted as 'Leghorns,' so one-fourth of all quotations on live poultry employs the word 'Leghorn.' You doubtless can see my curiosity to know where you get the statement that the word Leghorn is not used.

"Without knowing, I am taking for granted that you referred to dressed poultry. If so, your observation was correct and the two quotations will give you an idea of what I think is a corrupt practice and I believe a real detriment to the Leghorn.

"The prices on live chickens quotes

Now you see how dealers are selling Leghorns as choice fowls but condemning them at the same time.

"It would not be right to dress small hens purchased at a low price and sell them as young chickens at a high price.

"It is the same practice with the Leghorns—buying under one name and selling under another.

"I think if a specific term is used in buying, such as cocks, hens, Leghorns, etc., that they should be sold under the same name.

"I agree with you that the good qualities of the heavier birds should be given more publicity, but I can't feel that anything is gained by trying to give credit to one breed thru discrediting another.

Missouri.

C. T. Patterson.

Growing Healthy Chicks

The proper time to begin to raise chicks is six months before the chick emerges from the shell, so the care of the breeding stock is of first importance. Use only mature stock for breeding; back of all successful

Pullet from first prize young pen White Plymouth Rocks at Boston, Jan., 1922. Owned by Sabrina Farm, Wellesley, Mass.

Pullet from first prize young pen White Plymouth Rocks at Boston, Jan., 1922. Owned by Sabrina Farm, Wellesley, Mass.

Leghorns less than others, then after they are dressed they are sold without this classification and are sold on weight as the only basis of classification.

"I believe that if there is enough difference to justify a definite classification while they are alive they deserve it when dressed.

"Last week I was in a butcher shop and in looking over about 4 dozen dressed chickens I asked the butcher if he made any difference in price between Leghorns and others, and he said: 'We don't buy Leghorns, as our trade requires better chickens,' and then reached over to pick out and show me the kind he always sold first. He laid out five which he said were the kind he preferred to sell. He further said, 'You see, they are not the largest but are round and plump and have an attractive appearance.' He looked almost dumbfounded when I told him that all five were Leghorns.

breeding and rearing live stock of any kind lies vitality.

Many people have trouble with partly grown chicks, due mostly to tight cooping, with accumulated droppings which give off odors, and which ruin many fine chicks. Plenty of room is an absolute essential requirement for successful rearing. The growing chicks need plenty of fresh air—abundant circulating, fresh air—and perch room at night, therefore, I train my chicks as soon as they are well feathered, four or five weeks, to roost in grape vines or low cherry trees, which eliminates a good deal of trouble with mites. Rain does not hurt them as much as close, hot quarters would. It is a law that is recognized by all successful poultrymen that sanitary roosting quarters are a pre-requisite to uniform growth and economical development of chicks, writes Mrs. John Hamilton in the Bulletin of the Rose Comb White Leghorn Club.

Foul yards contaminate and cause disease. If your runs are bare, plant oats, Swiss chard, rape, or some quick-growing crop. Do not neglect to provide shade, as the chicks are not so very big and may easily become sun-struck. Whatever the source, do not neglect shade where they find refuge on hot days.

If you are growing Standard exhibition birds, remember that the best chick in the world can be grown into a cull.

The American Breeds of Poultry

Every American Breeder Needs This Book

By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Penciled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Penciled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

MANKATO INCUBATORS

FACTORY TO USER

THE OLD RELIABLE HATCHER

with a record. Made by experts of 28 years' experience building and operating incubators and raising poultry. Wonderful special features, makes the Mankato the leader of all incubators. It hatches the highest per cent of strong chicks in any climate, winter or summer. Sold at lowest price under strong binding guarantee. It is the one high class hatcher that is made right and sold right. Don't experiment, get the dependable quality Mankato that has stood the test of time.

NO BETTER INCUBATOR MADE

Well made of best material in natural red wood finish, three thicknesses of walls, heavy pure copper hot water tank and boiler, perfect automatic regulator, correct ventilation, safety lamp, large oil tank—one filling to hatch, high nursery, tested thermometer, etc. Heavy, well insulated wall construction and special double heating system insures uniform temperature and highest percent hatches.

Mankato Incubator Co.
Box 734 Mankato, Minn.

How to Build Poultry Houses

A new book just out, devoted exclusively to the building of poultry houses of all kinds and descriptions. Besides telling how to build the houses properly, it tells how to make feed troughs, nest boxes and water troughs. It gives complete plans, as well as the approximate cost of construction. It also contains plans of roosts and dropping boards; the brood coop; the brooder house; the fattening coop; the Winter the brooder house; the fattening coop. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

Classified Advertisements

Under this heading ads will be inserted for eighteen cents per word each month for less than three months, or forty-five cents per word for three months. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under classified headings. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from American Poultry Journal than from any other poultry journal—none excepted. On writing any of these advertisers, mention American Poultry Journal. All copy for Classified Ads must reach us by the 17th of month preceding date of issue. These rates void after May 20th, 1923.

ANCONAS

SINGLE COMB ANCONAS—Something unusual, exhibition stock that lays; egg record 308. My winners West Michigan State Show for sale. None over \$5. Kenneth Wurtz, Muskegon, Mich. 12

S. C. ANCONA COCKERELS, heavy laying strain, \$2.50 to \$5. W. A. Orr, Springfield, Ill. 12

BABY CHICKS—Best grade Sheppard strain Anconas. Guaranteed extra strong. Prices reasonable. Catalogue free. Holtzapple Hatchery, Box B, Elida, Ohio. 12

BAST'S NEW STANDARD S. C. Anconas—Best Display, New York State Fair, Syracuse.—Great Hag-stown Fair; Champion Special Allentown Fair, America's Greatest Shows. Wonderful Cockerels reasonable. W. F. Bast, Phillipsburg, N. J. 11-1

A guide to success in this, the most difficult poultry problem

Know How to Turn Loss Into Profit

The results of many years of practical experience and study. Written by Prince T. Woods, a man who knows how and who can teach others. This book will save many dollars for any poultryman and is indispensable to the beginner.

Read These Chapter Titles Over

Chapter I—Selecting and Mating Breeding Stock. Chapter II—Food, Vegetable, Animal and Mineral. Chapter III—Fowls and Food. Chapter IV—Care and Management of Breeders. Chapter V—Eggs for Hatching. Chapter VI—Incubation, Natural and Artificial. Chapter VII—Brooding with Hens and with Brooders. Chapter VIII—Chick Foods and Feeding Chicks. Chapter IX—Growing Chicks. Chapter X—Fighting about White Diarrhea. What white diarrhea is. Symptoms of disease. Causes. Is there more than one form? Has germ of specific disease been found? Infection. Prevention. Treatment. Formula for a simple remedy which has proved effective in many cases in many climates for years.

Don't go through years of costly and discouraging experiments to learn the facts taught in this book. One chick saved will pay for it. Learn how to feed; to prevent disease; to make your own brooders, and feed for your chicks. 75c postpaid.

American Poultry Journal, 523 Plymouth Court, Chicago, Ill.

START RIGHT!

"The American Breeds of Poultry," by Frank L. Platt, will give you a thorough knowledge of all the dual purpose, meat and egg breeds, originated in America—know your own.

How to mate, how to breed and select. Not hot air, but the real basic essentials. Also the history of each of the American breeds. History is the tower of experience from which you can see the past and mate for the future.

Hundreds of Poultry Secrets Outlined in this NEW FREE BOOK!

"A Family of 5 Can Live on the Work of 54 Hens. That Sized Flock Will Pay the Bills of the Family and Permit It to Live Decently," said a practical poultry raiser before the U. S. Commission

I WANT TO SEND every poultry raiser my new, free, 96 page book of money-making poultry secrets. Over 46,000 people say that I have shown them the sure way to make money. Do you know that half your flock is eating up your profits? Do you know how to tell good layers? Do you know how to make every hen pay a good dividend? My free book tells how. Simply send name for your copy TODAY!

This FREE BOOK Tells You--

- How to Get More Eggs and Save Feed,
- How to Get Big Egg Yields in Cold Weather,
- How to Cull Money-Losing Hens Out of Your Flock.
- How to Tell Drones, Loufers and Poor Layers,
- How to Tell Good Layers Without Using Trap Nests,
- How to Mix and Balance Feed Ration to Get Egg Yield.
- How to Select Males or Females That Produce Hatchable Eggs and Strong Chicks,
- How to Prevent Colds, Roup and Other Diseases.
- How to Avoid White Diarrhea and Bowel Trouble,
- How to Feed Chicks From Start to Finish.

200 HENS—\$1,000

"By following your simple advice on feeding, housing and mating, I sold, from 200 hens and pullets, \$1,288.58 worth of eggs, baby chicks, broilers, cockerels and pullets in exactly seven months. My feed bill was \$246.89. The eggs alone amounted to \$490.92 besides 276 dozen I set in the incubator. My success is entirely due to you. I would not part with information you gave me at any price."—Mrs. Clara Rooks, Ohio.

Feeding Methods Bring Big Egg Yield

"As a result of the feeding methods you worked out for me, I am sure getting results; in fact, from pens today, (October 23), containing 600 pullets, I received 345 eggs. Very often they run more. One pen of 100 ran 73% today and one around 65% for the entire month. Really, I am making money before I expected."—Wm. Sands, Missouri.

Made Over \$2,000 Last Year

Mrs. Hume made over \$2,000 last year from eggs alone. H. M. Luttrell made over \$5.00 per hen net Profit!

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—fact that every breeder knows only too well.

Supreme at Madison Square Garden
Is Supreme Everywhere

MORE PRIZES AND SILVER CUPS

are being won by IMPERIAL "RINGLETS" in the hands of my customers throughout America and the World than by any other line or strain.

I believe the most prominent breeders everywhere are using IMPERIAL "RINGLET" blood to improve their stock—THIS MEANS SOMETHING—IMPERIAL "RINGLETS" are the standard for all the Barred Rocks in all America, and if you want the BEST you should have my IMPERIAL "RINGLETS."

GRAND WINNING SHOW BIRDS

The finest ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition. Cocks, cockerels, hens, pullets and pens. Their matchless "Ringlet" barring wins under all judges—As Layers They Stand Pre-eminent—Rare breeding birds for sale mated to produce 1st prize winners. They will improve any Barred Rocks in America—assume that you want the best Barred Rocks obtainable.

Elegant catalogue mailed upon request. Prices reasonable.

EGGS

From the finest exhibition matings in the world. One setting \$20, two settings \$35, four settings \$60, 100 eggs \$90
